Introduction

This traffic impact analysis (TIA) identifies potential transportation-related impacts associated with the construction of the residential development proposed east of Marvin Rd SE near 22nd Ave SE, located in the Urban Growth Area of Thurston County. As necessary, mitigation measures are identified that would reduce or offset significant transportation related impacts that the project may have on the surrounding transportation system.

Project Description

The proposed development is located in Thurston County within the City of Lacey's Urban Growth Area along the east side of Marvin Road SE. Figure 1 shows the site vicinity of the proposed project. The proposed project includes the development of a total of 182 residential units comprised of up to 51 townhomes and 131 single-family units. Access to the site is proposed via Marvin Road SE in alignment with Terri Court SE. A connection to the adjacent development to the north is also included with future options for connectivity to parcels south and west of the site. A preliminary site plan is shown on Figure 2. The project is anticipated to be constructed and occupied by 2026.

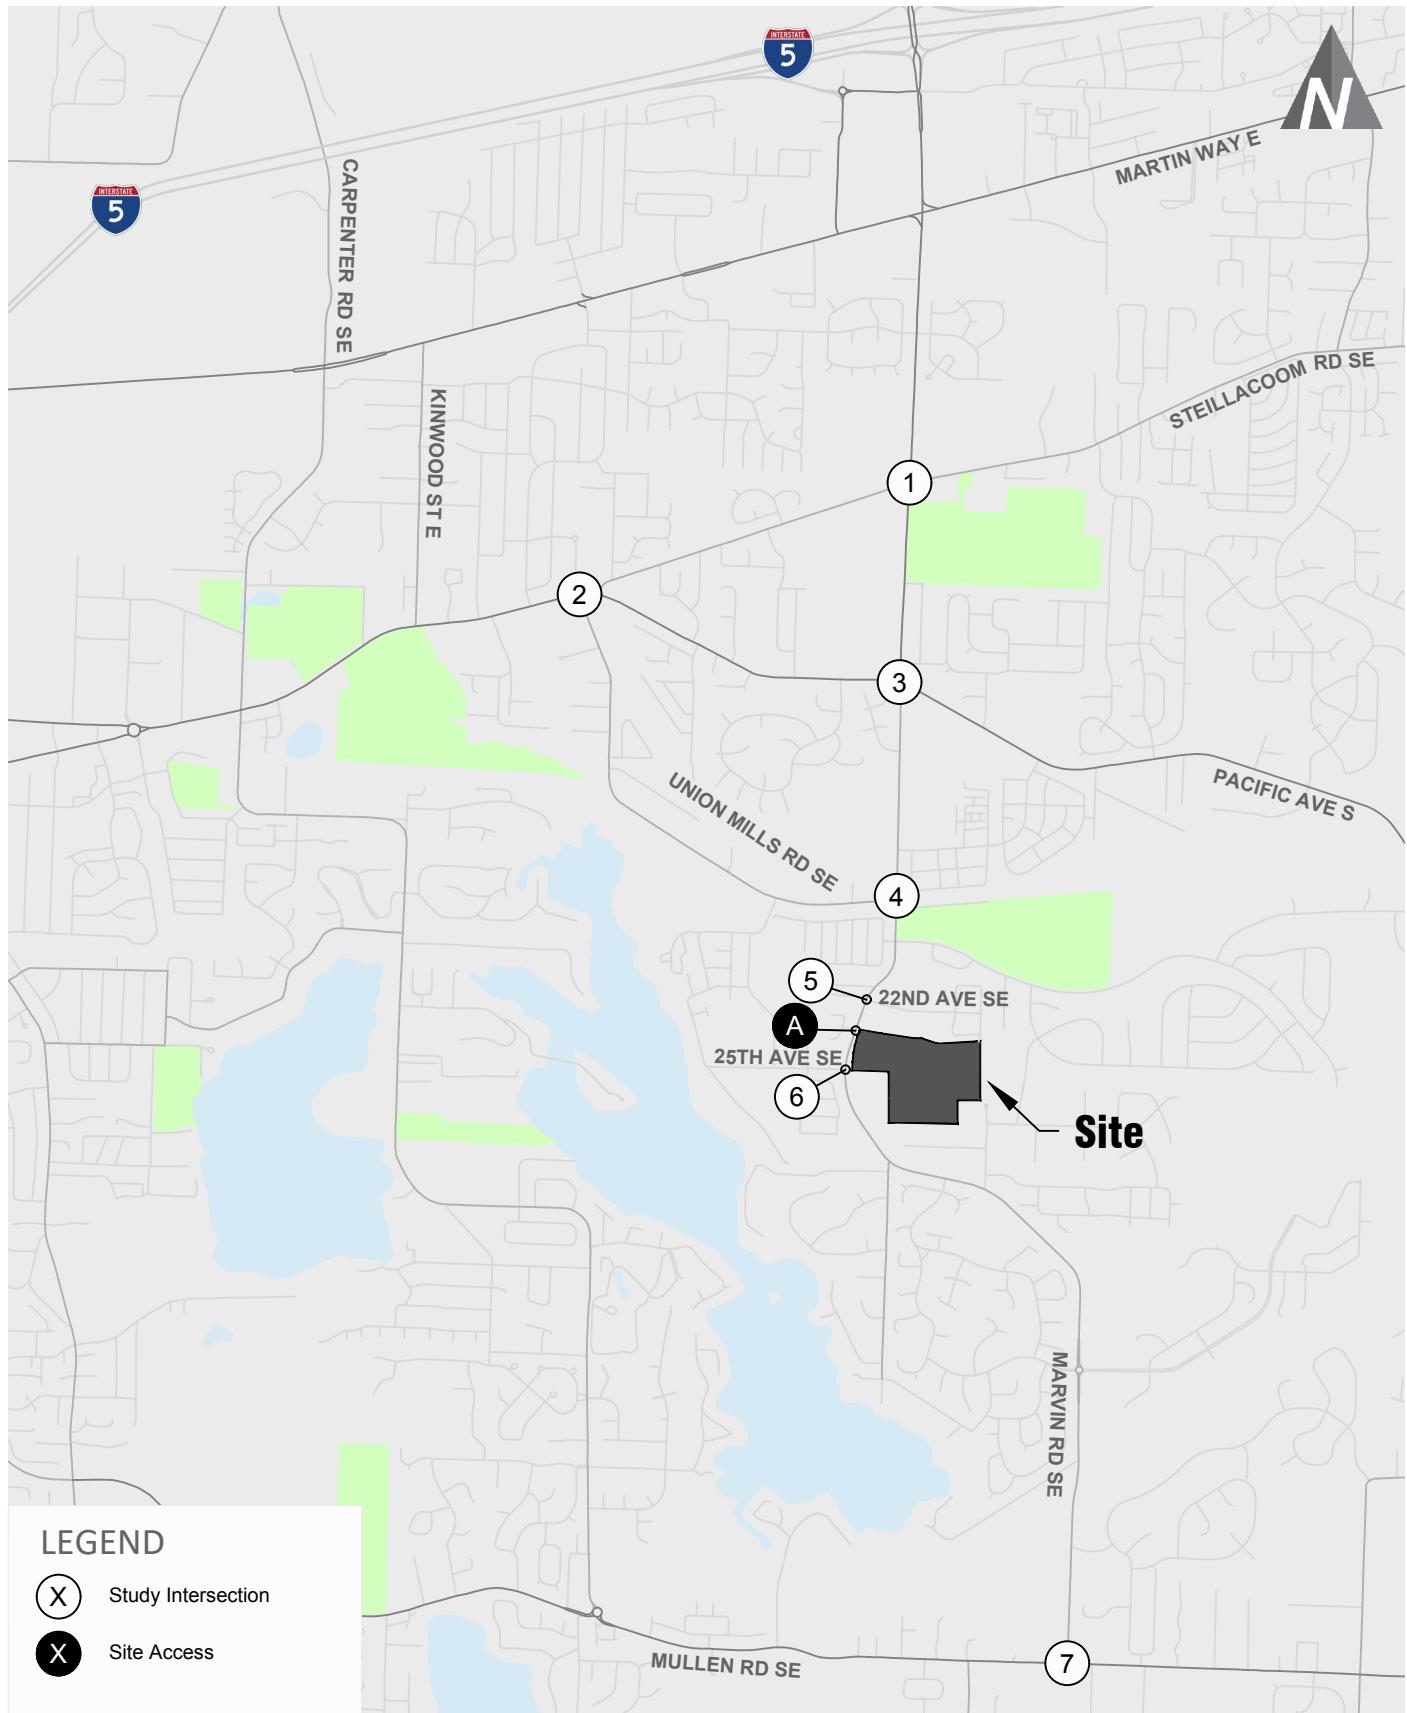

Study Scope

Given the project is located within the Urban Growth area, coordination occurred with both Thurston County and City of Lacey to identify the scope of work for this analysis. The following off-site intersections were selected for analysis:

1. Marvin Rd SE/Steilacoom Rd SE
2. Union Mills Rd SE/Pacific Ave SE
3. Marvin Rd SE/Pacific Ave SE
4. Marvin Rd SE/Union Mills Rd SE
5. Marvin Rd SE/22nd Ave SE
6. Marvin Rd SE/25th Ave SE
7. Marvin Rd SE/Mullen Rd SE

In addition, a site access along Marvin Road SE and Terri Court SE was evaluated under future (2026) with-project conditions.

The scope of the analysis included a review of existing and future without-project conditions in the vicinity of the project site under weekday PM peak hour conditions. This report includes a review of the surrounding street system, transit service, non-motorized facilities, existing and future without-project weekday peak hour traffic volumes, traffic operations, and traffic safety. Future (2026) with-project conditions were estimated by adding site-generated traffic to future without-project volumes. The project's impacts on the surrounding transportation system were identified by comparing the future with-project conditions to the future without-project conditions.

Existing and Future Without-Project Conditions

This section describes both existing and future (2026) without-project conditions within the identified study area. Characteristics are provided for the roadway network, non-motorized facilities, transit service, traffic volumes, traffic operations, and traffic safety.

Roadway Network

The following sections describe the existing street network within the vicinity of the proposed project and anticipated changes resulting from planned improvements.

Existing

The primary roadways within the study area and their characteristics near study intersections are described in reference to City of Lacey Functional Classification Plan described in Table 1.

Table 1. Existing Conditions Summary

Roadway	Street Classification	Speed Limit	No. of Lanes	Pedestrian Facilities	Bicycle Facilities
Marvin Rd SE (SR 510) ^{1,3}	Arterial	35/40	5/3 ²	Partial Sidewalks	None
Steilacoom Rd SE	Boulevard	35	3	Sidewalks	None
Pacific Ave SE (SR 510) ³	Arterial	40	2	None	None
Union Mills Rd SE	Boulevard	35	2	None	None
22nd Ave SE	Local	25	2	Sidewalks	None
25th AVE SE	Local	25	2	Sidewalks	None
Mullen Rd SE	Arterial	35	2	None	None

1. Posted speed limit is 35 mph between Steilacoom Rd SE to Union Mills Rd SE and 40 south of Union Mills Rd E

2. 5 lanes are present from Steilacoom Rd SE to Pacific Ave SE and reduced to 3 afterwards

3. SR 510 runs Marvin Rd SE from Steilacoom Rd SE and to east of Pacific Ave SE

Planned Improvements

A review of the *Thurston County 2023-2028 Transportation Improvement Plan (TIP)* shows there are multiple planned improvements that would be started or completed by 2026 in the vicinity of the proposed project. The planned improvements within the study area are primarily along Marvin Road. These include three phases as described below:

- **Marvin Road Upgrade Phase 1 (22nd Ave to Union Mills Rd) & Marvin Road Upgrade Phase 3 (Union Mills Rd to Pacific AVE)** – This will include adding sidewalks, streetlights, and traffic controls on Marvin Road from 22nd Ave to Pacific Ave. Roundabouts will be added to sections along this road to help traffic flow more freely. The improvements will reduce traffic delays and crashes and improve safety for cyclists and walkers.
- **Marvin Road Upgrade Phase 2 (Mullen Rd Intersection)** – This includes a roundabout at the intersection of Marvin Rd and Mullen Rd. The roundabout will provide for safer and more efficient turning movements as traffic increases. The project will also improve safety for walkers and cyclists.

Based on further coordination with the City, the roundabouts for the intersections of Marvin Road SE/Union Mills Rd SE and Marvin Road SE/Mullen Road SE are funded and will be completed prior to the 2026 horizon year. These two improvements were included in the future conditions operations analysis.

Non-Motorized Facilities

No sidewalks are provided in the close vicinity of the project site however, Marvin Road SE provides intermittent sidewalks along the study area. Signalized crossings are provided at the intersections of Marvin Rd SE/Steilacoom Rd SE and Marvin Rd SE/Pacific Ave SE.

Transit Service

Transit service in the study area is provided by Intercity Transit. The nearest bus stops to the proposed development are located at the site access intersection of Marvin Rd SE/Terri Ct SE. This stop is served by Route 67 with service between Pacific at Bowker, Lake Forest at Fordham, and TriLake Dr. at TriLake Loop with hourly headways throughout the days on both the weekdays and weekends.

Traffic Volumes

The following sections summarize existing and future (2026) without-project traffic volumes within the study area.

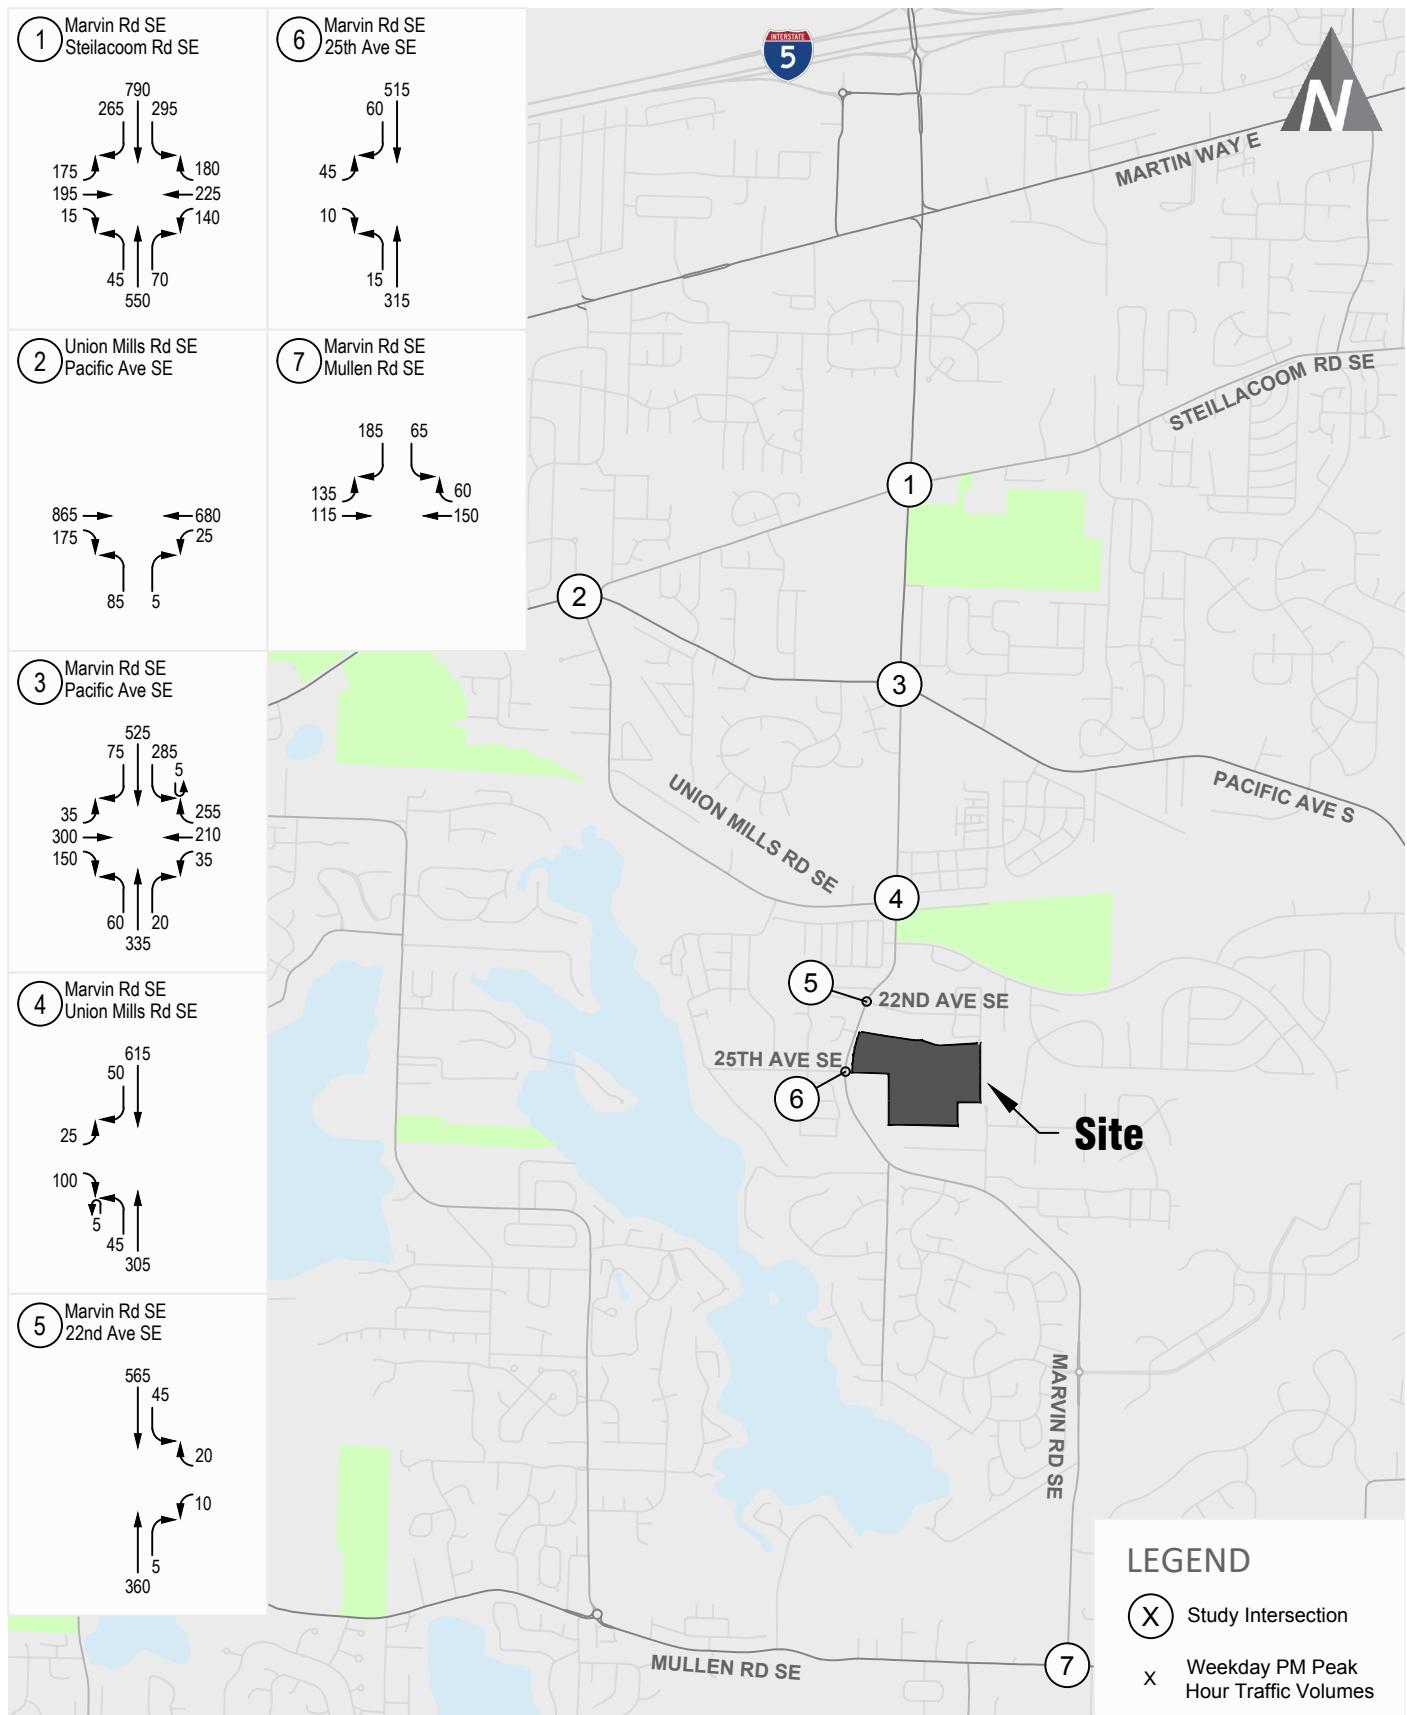

Existing

Existing weekday PM peak period (4-6 p.m.) traffic volumes were collected in June 2022 and August 2022. The estimated existing weekday PM peak hour traffic volumes are shown on Figure 3. Volumes are rounded to the nearest 5 vehicles to account for the daily fluctuations in traffic volumes. Detailed traffic counts are provided in Appendix A.

Future Without-Project Traffic Volumes

Future (2026) without-project traffic volumes are comprised of background traffic growth, and traffic generated from the planned “pipeline” developments. An annual growth rate of 4.0 percent was applied, through coordination with City and County staff. The annual growth rate was applied to the existing study intersection traffic volumes to estimate 2026 horizon year background traffic growth. Traffic from specific pipeline development projects in the vicinity was provided by City and County staff.

The forecast future 2026 without-project weekday peak hour traffic volumes are shown in Figure 4.

Traffic Operations

The operational characteristics of an intersection are determined by calculating the intersection level of service (LOS). At signalized, all-way stop controlled, and roundabout-controlled intersections, LOS is measured in average control delay per vehicle and is reported using the intersection delay. Traffic operations and average vehicle delay can be described qualitatively with a range of levels of service (LOS A through LOS F), with LOS A indicating free-flowing traffic and LOS F indicating extreme congestion and long vehicle delays. Appendix B contains a detailed explanation of LOS criteria and definitions.

Signal timing was optimized at the intersections based on the existing and future volumes. Analysis parameters such as lane channelization were maintained for future (2026) without-project conditions from existing conditions except for Marvin Rd SE/Union Mills Rd SE and Marvin Rd SE/Mullen Rd SE. The future 2026 conditions include the installation of roundabouts for traffic control at the intersections of Marvin Rd SE/Union Mills Rd SE and Marvin Rd SE/Mullen Rd SE.

Weekday PM peak hour traffic operations for existing and future (2026) without-project conditions were evaluated based on the procedures identified in the *Highway Capacity Manual* (HCM 2016) using *Synchro 11* for stop-controlled and signalized intersections. *Synchro 11* is a software program that uses HCM methodology to evaluate intersection LOS and average vehicle delay. The roundabouts were evaluated using *SIDRA Intersection 9*, and the WSDOT SIDRA protocol was followed to implement the correct parameters and environment factors. Results for the existing and future without-project operations analyses are summarized in Table 2. Detailed LOS worksheets for each intersection analysis are included in Appendix C.

Table 2. Existing and Future Without-Project PM Peak Hour LOS Summary

Intersection	Current Traffic Control / Future Traffic Control	Existing			2026 Without-Project		
		LOS ¹	Delay ²	v/c WM ³	LOS	Delay	v/c WM
1. Marvin Rd SE/Steilacoom Rd SE	Signal	B	18	-	D	47	-
2. Union Mills Rd SE/Pacific Ave SE	Signal	B	14	-	B	15	-
3. Marvin Rd SE/Pacific Ave SE	RAB	A	7	0.363	A	10	0.646
4. Marvin Rd SE/Union Mills Rd SE	TWSC / RAB	C	17	EB	A	6	0.909
5. Marvin Rd SE/22nd Ave SE	TWSC	B	12	WB	B	14	WB
6. Marvin Rd SE/25th Ave SE	TWSC	B	15	EB	C	20	EB
7. Marvin Rd SE/Mullen Rd SE	TWSC / RAB	B	14	SB	A	7	0.388

Note: RAB = roundabout, TWSC = two way stop controlled.

1. Level of Service (A – F) as defined by the *Highway Capacity Manual* (TRB, 6th Edition)

2. Average delay per vehicle in seconds

3. Volume-to-capacity ratio shown for roundabout intersections. Worst Movement shown for stop controlled intersections

As shown in Table 3, all intersections are operating at LOS D or better under existing conditions during the PM peak hour. Under future (2026) without-project conditions, all intersection will continue to operate at LOS D or better during the PM peak hour.

Traffic Safety

The five most recent years of collision records (January 1, 2017 to December 31, 2021) provided by the Washington State Department of Transportation (WSDOT) were reviewed within the study area to identify any existing traffic safety issues at the study intersections and along the roadway segments adjacent to the project site accesses. A summary of the total and average annual number of reported collisions at the study intersections and roadway segment adjacent to the project site are provided in Table 3.

Table 3. Five-Year Collision Summary (2017-2021)

Location	Number of Collisions					Total	Annual Average	Collisions per MEV ¹
	2017	2018	2019	2020	2021			
<i>Intersection</i>								
1. Marvin Rd SE/Steilacoom Rd SE	9	3	2	2	5	21	4.2	0.39
2. Union Mills Rd SE/Pacific Ave SE	2	1	0	0	0	3	0.6	0.09
3. Marvin Rd SE/Pacific Ave SE	6	2	5	4	4	21	4.2	0.50
4. Marvin Rd SE/Union Mills Rd SE	0	1	0	0	0	1	0.2	0.05
5. Marvin Rd SE/22nd Ave SE	1	0	0	0	0	1	0.2	0.05
6. Marvin Rd SE/25th Ave SE	0	0	0	0	0	0	0.0	0.00
7. Marvin Rd SE/Mullen Rd SE	0	2	2	0	2	6	1.2	0.46

Source: WSDOT September 2022

Under 23 U.S. Code § 409 and 23 U.S. Code § 148, safety data, reports, surveys, schedules, lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

1. MEV = Million Entering Vehicles at an intersection location.

The off-site study intersections had a total of 51 collisions from 2017 to 2021 between the seven study intersections with highest annual average being 4.2 collision over the recent five-year period at the intersections of Marvin Rd SE/Steilacoom Rd SE and Marvin Rd SE/Pacific Ave SE. All of the collisions per MEV were below 1.00. The most common collision type at the intersections were rear end collisions which resulted mostly in property damage only (PDO). Of all collisions there were 38 PDO, 15 injuries and 0 fatalities. Rear end collisions are common with stop and go traffic such as at stop control or signalized intersections. There were no collisions reported involving pedestrian or bicyclist throughout the five years. Overall, no existing safety issue needing further reviewed were identified based on the data.

Project Impacts

The following sections summarize the proposed project's impacts on the surrounding street system. First, traffic volumes generated by the proposed project are estimated and then distributed and assigned to adjacent roadways within the study area. Next, project trips are added to future without-project traffic volumes and the potential impact to traffic operations are identified. Site-specific items are also discussed.

Trip Generation

Trip generation for the proposed project was based on established trip rates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021). For the proposed land use, the Single-Family Attached Housing (LU 215) and Single-Family Detached Housing (LU 210) were used. Table 4 summarizes the resulting PM peak hour vehicle trip generation for the proposed project. Detailed trip generation calculations are provided in Appendix D.

Table 4. Trip Generation Summary – Weekday PM Peak Hour

<u>Land Uses</u>	Size	Rate	New Trips		
			In ²	Out ²	Total
<u>Proposed</u>					
Single-Family Detached Housing (LU #210)	131 du	0.94	77	46	123
Single-Family Attached Housing (LU #215)	51 du	0.57	17	12	29
Total			94	58	152

Note: du = dwelling units.

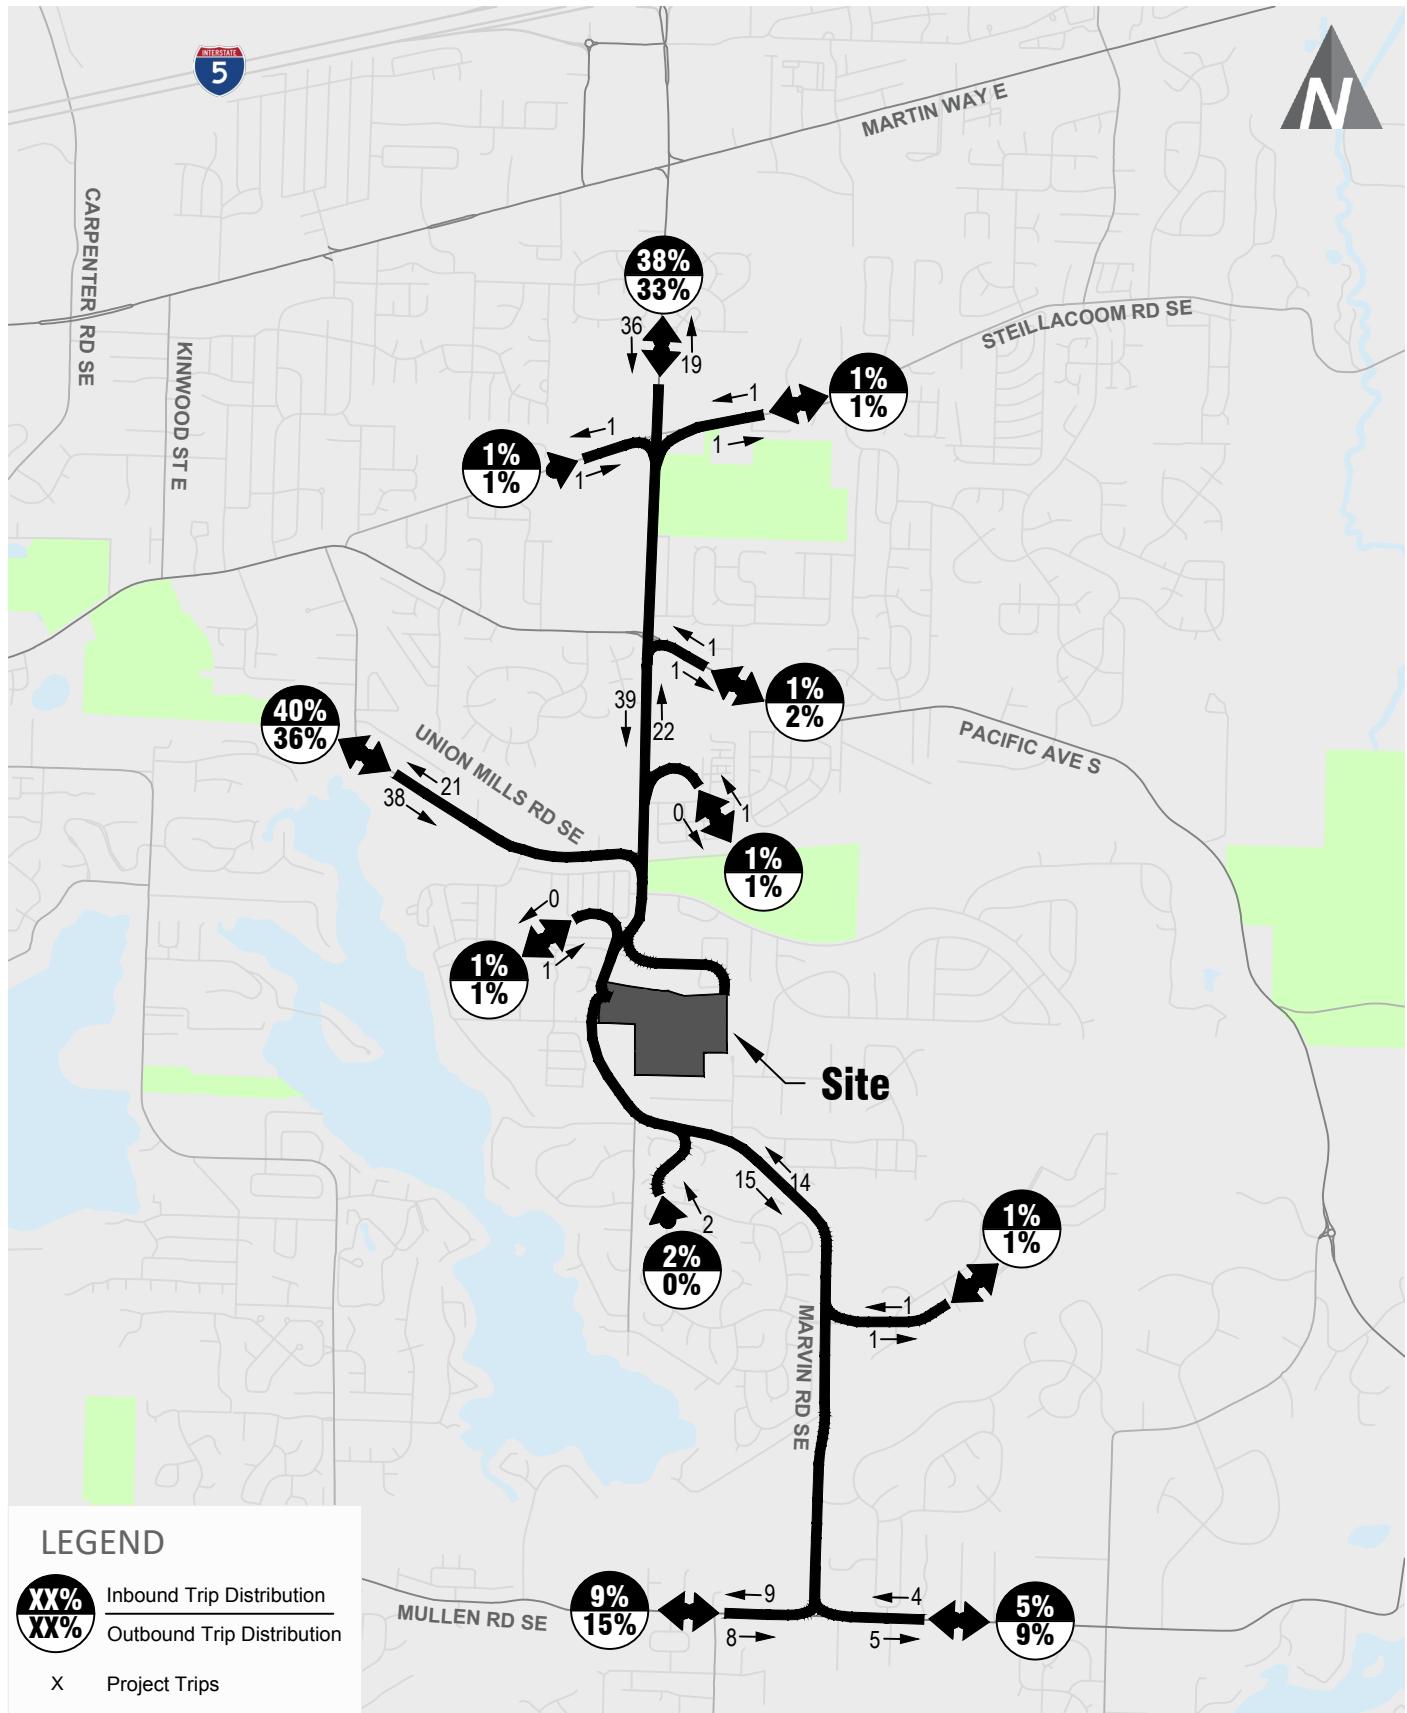

1. Average trip rates from ITE Trip Generation Manual, 11th Edition (2021).

As shown in Table 4 the proposed development is anticipated to generate 152 net new trips to the area during the weekday PM peak hour, 94 of which will be inbound trips and 58 outbound trips.

Trip Distribution & Assignment

The Thurston County Regional Traffic Demand model was utilized to identify trip distribution patterns in the area. A model plot for the site was provided by the City and specific trips from the project were assigned to the roadway network. This information was reviewed and approved by County and City staff during the scoping efforts. The trip distribution and assignment are displayed in Figure 5. The model plot is included in Appendix E.

To calculate future (2026) with-project traffic volumes, PM peak hour project trips were added to the future (2026) without-project traffic volumes. The future (2026) with-project volumes are displayed in Figure 6.

Traffic Operations Impact

A future (2026) with-project level of service analysis was conducted for the weekday peak hour to analyze traffic impacts of the proposed project. The same methodologies were applied as described for existing and future without-project conditions. All intersection parameters such as channelization, intersection control, and signal timing were consistent with those used in the evaluation of future without-project conditions. A comparison of future (2026) without-project and with-project weekday peak hour traffic operations is summarized in Table 5. Detailed LOS worksheets are provided in Appendix C.

Table 5. Future Without-Project and With-Project PM Peak Hour LOS Summary

Intersection	Future Traffic Control	2026			2026		
		Without-Project			With-Project		
		LOS ¹	Delay ²	v/c WM ³	LOS	Delay	v/c WM
1. Marvin Rd SE/Steilacoom Rd SE	Signal	D	47	-	D	49	-
2. Union Mills Rd SE/Pacific Ave SE	Signal	B	15	-	B	16	-
3. Marvin Rd SE/Pacific Ave SE	RAB	A	10	0.646	A	10	0.665
4. Marvin Rd SE/Union Mills Rd SE	RAB	A	6	0.909	A	9	0.963
5. Marvin Rd SE/22nd Ave SE	TWSC	B	14	WB	C	15	WB
6. Marvin Rd SE/25th Ave SE	TWSC	C	20	EB	C	21	EB
7. Marvin Rd SE/Mullen Rd SE	RAB	A	7	0.388	A	7	0.402
8. Marvin Rd SE/Terri Ct SE (Site Access)	TWSC	-	-	-	D	33	EB

Note: RAB = roundabout TWSC= two way stop controlled

1. Level of Service (A – F) as defined by the *Highway Capacity Manual* (TRB, 6th Edition)

2. Average delay per vehicle in seconds.

3. Volume-to-capacity ratio shown for roundabout intersections. Worst Movement shown for stop-controlled intersections

As shown in Table 5, the study intersections are all forecast to operate at the same LOS levels with the project relative to without-project conditions during both the weekday PM peak hour, with the exception of Marvin Rd SE/22nd Ave SE. This intersection was operating at the LOS B threshold and the additional one second of delay degraded the intersection from LOS B to LOS C, which continues to operate at an acceptable level of service. The site access at the intersection of Marvin Rd SE/Terri Ct SE at full build-out is forecast to operate at LOS D as shown in Table 5, which also meets the county requirement of LOS D or better. Based on the acceptable Levels of Service forecast at the off-site and on-site study intersections, there are no mitigations required for the project.

Findings and Recommendations

This traffic impact analysis summarizes the project traffic impacts of the proposed McAllister Springs development. General findings and recommendations include:

- The proposed project would construct 51 townhomes and 131 single-family units and is anticipated to generate 152 net new trips during the PM peak hour.
- All off-site study intersections would meet the City of Lacey's LOS D or better standard not triggering any mitigation.
- Access to the site would be provided via an stop-controlled intersection of Marvin Rd SE/Terri Ct SE. The site driveway is forecast to operate at LOS D or better during the weekday PM peak hour.
- The proposed project will be required to pay Traffic Impact Fees to mitigate impacts to planned transportation improvement projects in the area. Thurston County and the City of Lacey will calculate the specific fees after review of the project application.

Appendix B: LOS Definitions

Highway Capacity Manual 2010/6th Edition

Signalized intersection level of service (LOS) is defined in terms of a weighted average control delay for the entire intersection. Control delay quantifies the increase in travel time that a vehicle experiences due to the traffic signal control as well as provides a surrogate measure for driver discomfort and fuel consumption. Signalized intersection LOS is stated in terms of average control delay per vehicle (in seconds) during a specified time period (e.g., weekday PM peak hour). Control delay is a complex measure based on many variables, including signal phasing and coordination (i.e., progression of movements through the intersection and along the corridor), signal cycle length, and traffic volumes with respect to intersection capacity and resulting queues. Table 1 summarizes the LOS criteria for signalized intersections, as described in the *Highway Capacity Manual 2010* and 6th Edition (Transportation Research Board, 2010 and 2016, respectively).

Table 1. Level of Service Criteria for Signalized Intersections

Level of Service	Average Control Delay (seconds/vehicle)	General Description
A	≤10	Free Flow
B	>10 – 20	Stable Flow (slight delays)
C	>20 – 35	Stable flow (acceptable delays)
D	>35 – 55	Approaching unstable flow (tolerable delay, occasionally wait through more than one signal cycle before proceeding)
E	>55 – 80	Unstable flow (intolerable delay)
F ¹	>80	Forced flow (congested and queues fail to clear)

Source: *Highway Capacity Manual 2010 and 6th Edition*, Transportation Research Board, 2010 and 2016, respectively.

1. If the volume-to-capacity (v/c) ratio for a lane group exceeds 1.0 LOS F is assigned to the individual lane group. LOS for overall approach or intersection is determined solely by the control delay.

Unsignalized intersection LOS criteria can be further reduced into two intersection types: all-way stop and two-way stop control. All-way stop control intersection LOS is expressed in terms of the weighted average control delay of the overall intersection or by approach. Two-way stop-controlled intersection LOS is defined in terms of the average control delay for each minor-street movement (or shared movement) as well as major-street left-turns. This approach is because major-street through vehicles are assumed to experience zero delay, a weighted average of all movements results in very low overall average delay, and this calculated low delay could mask deficiencies of minor movements. Table 2 shows LOS criteria for unsignalized intersections.

Table 2. Level of Service Criteria for Unsignalized Intersections

Level of Service	Average Control Delay (seconds/vehicle)
A	0 – 10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F ¹	>50

Source: *Highway Capacity Manual 2010 and 6th Edition*, Transportation Research Board, 2010 and 2016, respectively.

1. If the volume-to-capacity (v/c) ratio exceeds 1.0, LOS F is assigned an individual lane group for all unsignalized intersections, or minor street approach at two-way stop-controlled intersections. Overall intersection LOS is determined solely by control delay.

Site Level of Service (LOS) Method: Delay & Degree of Saturation (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & Degree of Saturation (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & Degree of Saturation (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & Degree of Saturation (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & Degree of Saturation (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Signalised Intersections.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
