<sup>1</sup> NOAA runs the Olympia Airport weather station; TC Water Planning records the data and uses it in analysis.

<sup>2</sup> The level on Hicks Lake has been monitored by a volunteer for many years. In 2018 the volunteer data were entered into the central water database and new data are being recorded as they are reported.

## Executive Summary - Water Year 2018

---

### Activities

In Water Year 2017 (October 1, 2017 through September 30, 2018) Thurston County Water Planning maintained a total of 74 monitoring stations.

**Table 1: WY 2018 Station Summary**

Type	Count
Weather and Atmosphere <sup>3</sup>	16
Surface Water (Stream and Lake) <sup>4</sup>	17
Groundwater	41
Total (2018)	74

One stream gauging station was relocated (Black River), one precipitation station was relocated (Rainier), and three monitoring wells were taken over by Tumwater.

In 2018 Water Planning continued installing telemetered stations that can relay data to a central database without the need for a physical field visit. Weather stations at Summit Lake and Rainier, the new groundwater monitoring well at Walter Court, and stream gauges at Black Lake Ditch and Eaton Creek were all upgraded with telemetered equipment; the planned telemetry at Deschutes Falls Park was delayed due to lack of cell signal. A grant from the Chehalis River Basin Flood Authority will enable telemetry at 7 precipitation stations and 4 stream gauges.

### Year In Review

Fall 2017 had about average temperatures through December, which were cooler than fall 2016. In January and February 2018 the temperature increased to well above normal, before falling to much colder than normal temperatures in March, with a correspondingly high number of days with freezing temperatures. Thereafter temperatures were about normal for time of year, except for a spike of high temperatures in August of 2018.

Water Year 2018 was a return to normal precipitation patterns after the abnormally wet years of 2016 and 2017. From October 2017 through April 2018 rainfall was either the same as or greater than average. After April rainfall mostly ceased, and total precipitation accumulation for the water year was within an inch or two of average.

Streams during WY 2018 generally followed precipitation trends, with discharges increasing throughout the winter and into the spring. Most streams had average to above average total discharges. Discharges at Salmon Creek and Green Cove tapered off in May to minimal volumes, while Eaton, Spurgeon, Woodland, and Woodard creeks continued to discharge significant volumes through the end of the year.

---

<sup>3</sup> In addition to the 16 stations maintained by TC Water Planning, two USGS precipitation stations were funded by TC Water Planning in 2018, and data were retrieved from the Olympia Airport every month, for a total of 19 stations.

<sup>4</sup> In addition to the 17 stream and lake monitoring stations maintained by TC Water Planning in 2018, there was one volunteer station (Hicks Lake), and the Thurston County Environmental Health program, funded by TC Water Planning, monitored additional streams as described in their Annual Report.

**SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning**

Groundwater levels in WY 2018 started higher than normal because of the back-to-back wet years of 2016 and 2017. However, peak groundwater levels were lower than the previous year and near the historic average, and groundwater levels were lower on September 30, 2018 than they were at the same time in 2017.

## SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

### Background and Introduction

---

The Thurston County Water Resources, Environmental Monitoring Program (EMP) is responsible for installing, maintaining and collecting data from 74 monitoring stations placed throughout Thurston County to measure atmospheric conditions, streamflow, and groundwater and lake levels. This report contains mostly data relating to volumes and quantities of water; it does not discuss chemical, physical, or biological parameters of the waters of the County. The Thurston County Environmental Health Division (TCEH) collects and presents chemical and biological parameter data as their major contribution to this annual report. Those data are available as a supplemental report in conjunction with this document.

Of the 74 stations mentioned above, six are part of an Inter-local Monitoring Agreement (ILMA) between Thurston County and the Cities of Lacey, Tumwater, and Olympia (TCEH monitors several stream sites that are not part of this report for water quality parameters under the ILMA). Monitoring under the ILMA began in the early 1990s and has provided our partnership with millions of data records since its inception. The data are used to gauge the condition of our water resources in the northern part of Thurston County and within the jurisdictions of the cooperative partners. The cost of the ILMA is divided between the partners based on the number and type of equipment that is located within their respective boundaries. These data are useful not only for evaluating the general health of our systems, but also for engineering and flow modeling for basin and critical areas planning and regulatory issues.

In addition to the ILMA, Thurston County also maintains a larger program called the General Environmental Monitoring (GEM) Program. This concurrent program contains the majority of the stations that are deployed throughout Thurston County. This program has grown steadily since its founding in 2000. The purpose of the wider GEM program is to evaluate *all* aspects of the water cycle countywide to include atmospheric conditions, streamflow stages and volumes, and groundwater and lake levels. The data collected from both the ILMA and the GEM are maintained by Thurston County and provided to our partners and the public online.

This report is prepared to provide a summary of findings for Water Year 2018. Thurston County has elected to include both the ILMA data and the GEM data together in this summary report to provide a complete picture of the water cycle in Thurston County from the clouds to the Sound and what the water does on its journey.

This report is a summary of WY 2018. It also contains long term records where the period of record provides a wider perspective on the subject water year. Running averages and daily summaries are used as comparison values for many sites to compare and contrast this water year with historic values. The data presented in this report, as well as all other, more detailed datasets, are available upon request.

The Environmental Monitoring Program maintains a dashboard of current and historical data at <https://www.thurstoncountywa.gov/sw/Pages/monitoring-dashboard.aspx>. This dashboard contains long term records of daily averages, and the latest data from the County's five telemetered sites.

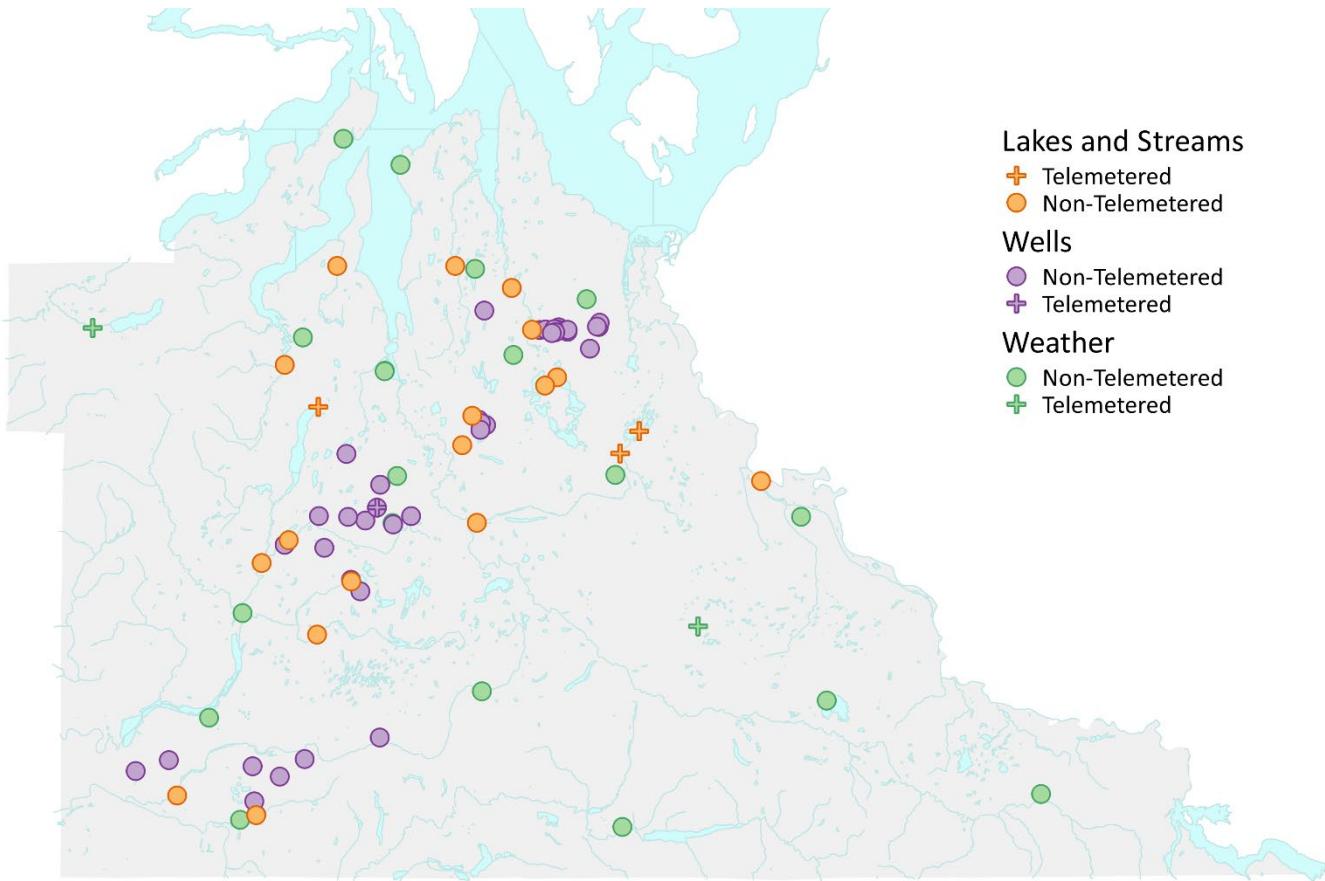

### General

In WY 2018 (October 1, 2017 – September 30, 2018), Community Planning and Economic Development Water Planning collected data from 74 monitoring sites across Thurston County.

Below is a map of the locations and type of monitoring stations we currently have active in the field as of January 1, 2019. [Table 1](#) Identifies the type and number of each station.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 1: All Monitoring Sites Map**

By late 2018 six sites were reporting data remotely over the cell network (telemetered): the Summit Lake and Rainier weather stations; Lake St. Clair, Eaton Creek, and Black Lake Ditch surface water gauging sites; and the LRS-08a monitoring well off of Walter Court.

**Table 2: WY 2018 Station Summary**

Type	Count
Weather and Atmosphere <sup>5</sup>	16
Surface Water (Stream and Lake) <sup>6</sup>	17
Groundwater	41
Total (2018)	74

<sup>5</sup> In addition to the 16 stations maintained by TC Water Planning, two USGS precipitation stations were funded by TC Water Planning in 2018, and data were retrieved from the Olympia Airport every month, for a total of 19 stations.

<sup>6</sup> In addition to the 17 stream and lake monitoring stations maintained by TC Water Planning in 2018, there was one volunteer station (Hicks Lake), and the Thurston County Environmental Health program, funded by TC Water Planning, monitored additional streams as described in their Annual Report.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Chehalis Basin Telemetry Project**

In 2018 the Chehalis River Basin Flood Authority approved an approximately \$50,000 grant to Thurston County for telemetry upgrades at 7 weather stations and 4 stream stations, plus the IT work required to push those data into their computer systems. As of October 1, 2018 the contracts were still being finalized; all the work for that grant will be completed in water year 2019.

## Weather and Atmospheric Monitoring

---

### Stations and Equipment

Thurston County monitors weather at 19 sites. Some sites were established as recently as 2017; others have data extending back to 1988. NOAA has maintained records at the Olympia airport since 1955. The oldest records date back to 1898 from Priest Point Park in Olympia. We employ several types of sensors to collect a multitude of atmospheric parameters. The most common type of precipitation station collects rainfall and temperature. Several locations collect multiple parameters including barometric pressure, solar radiation, wind speed and direction. Two stations also calculate and report irradiance and evapotranspiration (ET). One of the multi-parameter stations, Thurston County Building 4 West Olympia (23u), reports real time data online as part of the DavisNet worldwide weather station network.

In 2017, Thurston County began deploying automated weather stations with telemetry. This feature allows the weather stations in the field to report their data back to the central database autonomously. By the end of WY 2018 the Summit Lake (69u) and Rainier Fire Station 4 (11z) sites were operating with telemetry.

The Rainier Drop Box station (11w) was retired and replaced with the Rainier Fire Station 4 station in May of 2018 due to vandalism. While the original equipment continued to function, the original site was considered too insecure to continue with monitoring. The old Onset equipment was replaced with new Campbell Scientific and Sierra Wireless equipment.

Thurston County also negotiated with Bucoda to install a new weather station on an open parcel adjacent to City Hall. This weather station will replace two USGS operated stations that are currently financially supported by the County – Bloody Run (59u) and Bucoda (60u).

Finally, the County successfully applied for a grant from the Chehalis River Basin Flood Authority for \$50,000. This grant will allow the County to purchase telemetry equipment for seven rain stations and four stream gauges in and around the Chehalis River basin, and contract with an IT company to expand the capabilities of the County's GData water data management system.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 2: Weather Stations Map

## Temperature

### Warm January, Colder March, Normal Remainder of Year

Temperatures from October through December of 2017 were unremarkable, staying near normal values. January was unusually warm, with very few days dropping below freezing and mean temperatures well above normal. That trend reversed in February and especially March, with mean temperatures below normal and a much higher than normal number of days with sub-freezing temperatures.

**Temperature** – The winter of 2016-17 was the coldest on record for the Olympia area in over 30 years. October 1, 2016 through April 30, 2017 recorded 28 days below freezing ( $\leq 32^{\circ}\text{F}$ ) at the Olympia Regional Airport (several more days in outlying areas of Thurston County). Freezing days is just one measure of cold; the average air temperature was also persistently low. Daytime highs in October through mid-March 2017 were on average several degrees below normal.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 3: Mean Temperatures at Olympia Airport

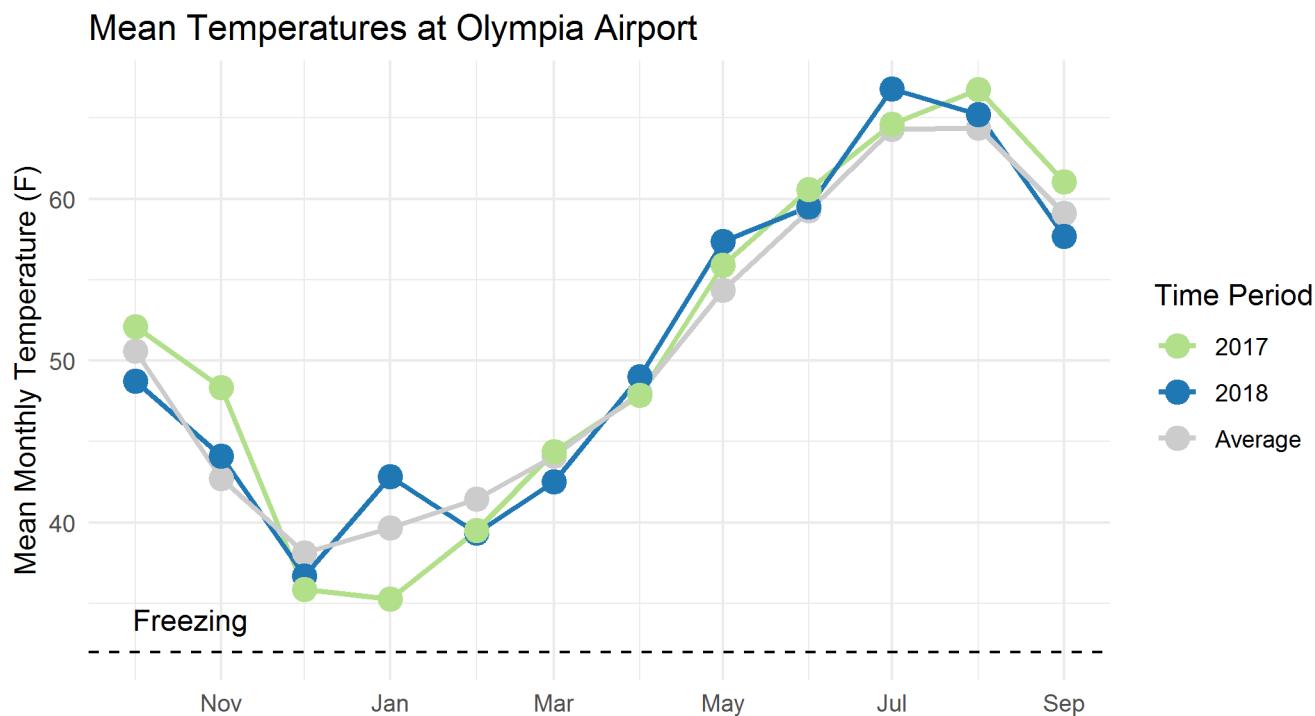

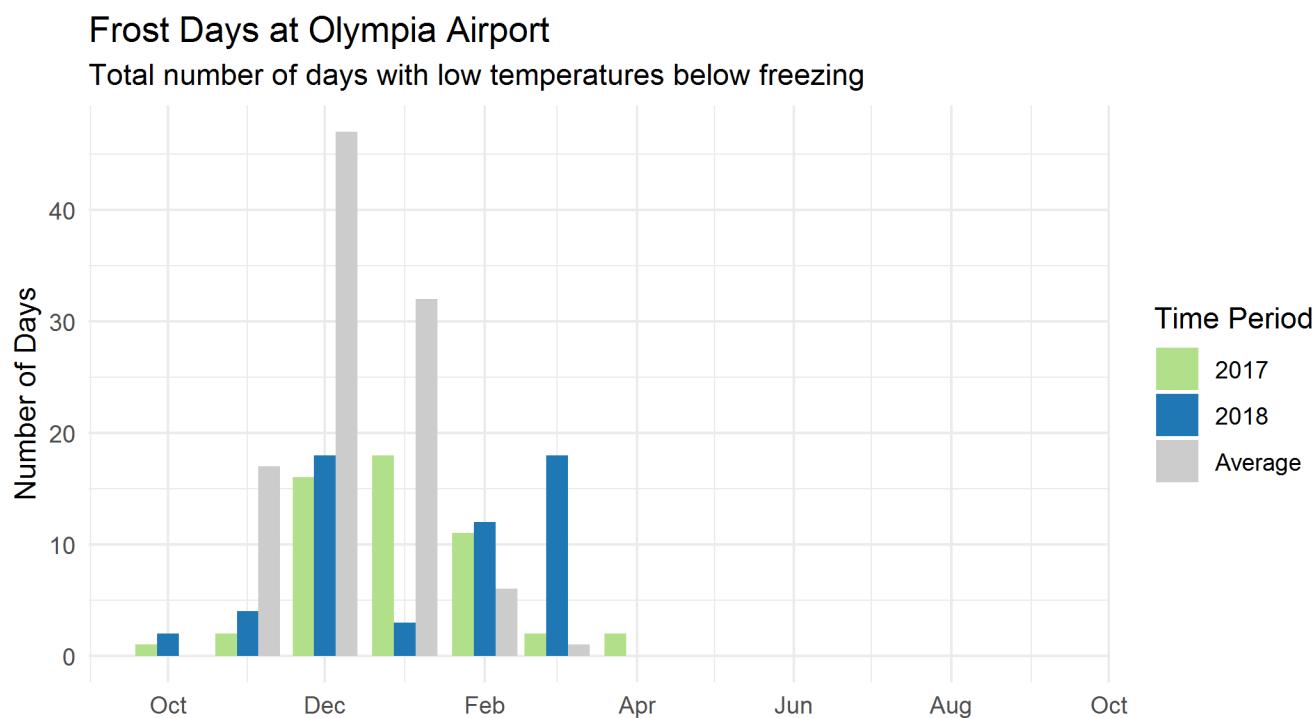

Figure 4: Frost Days at Olympia Airport

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Table 3: Air Temperature Summaries**

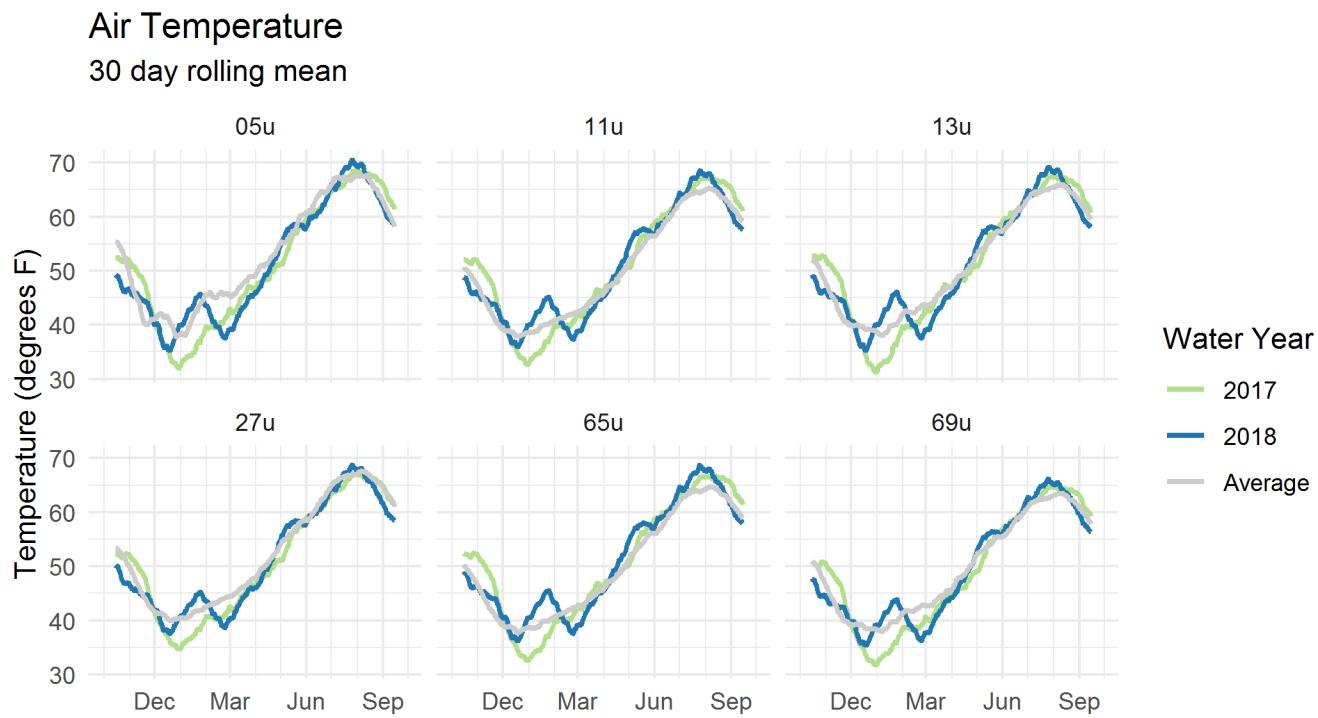

Weather Station	Mean	Minimum	Maximum
05u: Yelm WRF	51.5	13.0	95.8
10u: Meridian Rd	51.2	15.6	94.3
11u: NOAA Olympia Airport	50.9	15.1	95.0
13u: Lake Lawrence	51.2	14.2	94.8
18u: Lacey Fire Dist. 3 Fire Station	52.4	20.0	98.9
18w: WARC TC	52.3	21.1	95.6
20u: Southbay Firestation	51.8	21.0	97.7
23u: Percival Creek, Bldg 4	52.4	23.4	95.8
24u: McLane FS Wx	51.8	18.9	98.1
27u: Boston Harbor	51.7	22.9	95.6
33x: Griffin FS 13-2	51.7	23.6	96.6
45u: Littlerock	50.8	12.8	98.0
45w: Rochester Drop Box	50.9	16.5	99.6
55u: Tenino	50.7	13.4	96.1
65u: Grand Mound	51.1	14.1	96.3
69u: Summit Lake	49.6	17.0	97.6

The coldest temperature recorded at the Olympia airport was 15 degrees F above zero; around the county, minimum temperatures ranged from 13 degrees F (Yelm) to 23.5 degrees F (Percival Creek and Griffin Fire Station). These temperatures range from normal for USDA Zone 8a, which covers most of Thurston County, to warm even for USDA Zone 8b, which covers just the northernmost Puget Sound coastline. The warmer locations tended toward costal (northern), urban, and low elevation locations, all of which tend to raise daily minimum temperatures. Normal to warm temperatures tend to protect plants from frost damage, but may also lead to increased insect predation.

Maximum temperatures were higher in water year 2018 compared to 2017 and to the average of previous years. Temperatures peaked in the mid- to high-90s in August. Such high heats can stress plants and increase water consumption.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 5: Air Temperatures at Select Weather Stations

## Precipitation

Compared with the wet years of 2016 and 2017, 2018 constituted a return to normal precipitation patterns throughout the county. Every weather station recorded less cumulative rainfall in 2018 than in 2017, and only Summit Lake recorded appreciably more rainfall in 2018 than average.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

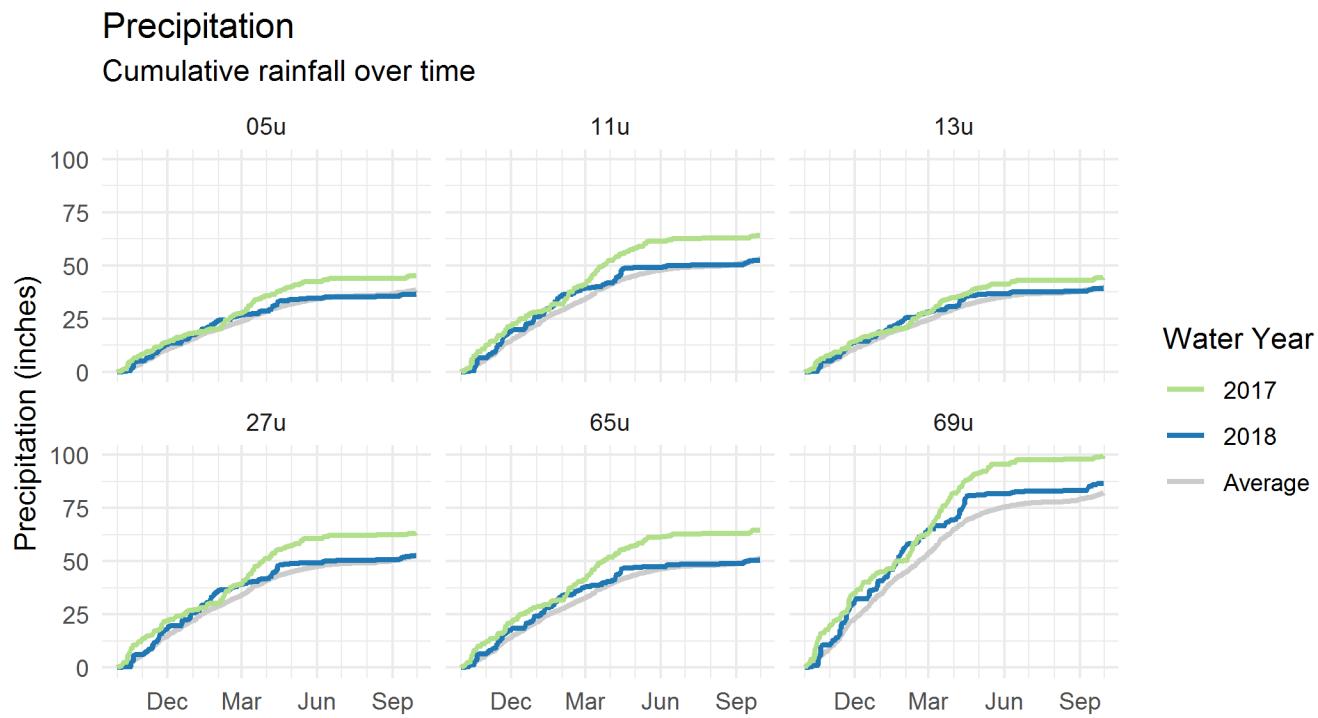

**Table 4: WY 2018 Total Rainfall**

<b>Site Name</b>	<b>Rain (inches)</b>
05u: Yelm WRF	36.63
10u: Meridian Road	45.80
11u: NOAA Olympia Airport	52.39
13u: Lake Lawrence	39.35
18u: Lacey Fire Dist. 3	49.91
18w: WARC TC	43.73
20u: South Bay Firestation	45.79
23u: Percival Creek, Bldg. 4	53.62
24u: McLane Firestation	67.71
27u: Boston Harbor	52.36
33x: Griffin Firestation 13-2	50.35
45u: Littlerock	67.30
45w: Rochester Drop Box	51.00
55u: Tenino	51.21
59u: Bloody Run USGS	42.55
65u: Grand Mound	50.59
69u: Summit Lake	86.62

As with most water years, the south and east of the county was generally drier than the north and west. 69u, the Summit Lake gauge, was much wetter than most other gauges throughout the county (86 inches in WY 2018), demonstrating the ability of the Black Hills to extract a lot of moisture out of the air as it travels east. The Summit Lake gauge has historically been the highest recorded rainfall station in the County. By the time storms arrive near Yelm (05u) and Rainier (11w), much of the water has already precipitated, leaving those areas drier than the rest of the county. Station 45u (Littlerock) has significantly more precipitation than station 45w (Rochester), despite a distance of only 5.5 miles between them, demonstrating the complexity of the precipitation patterns around the Black Hills and the Chehalis River gap on the west side of the county.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 6: Cumulative Precipitation at Select Weather Stations**

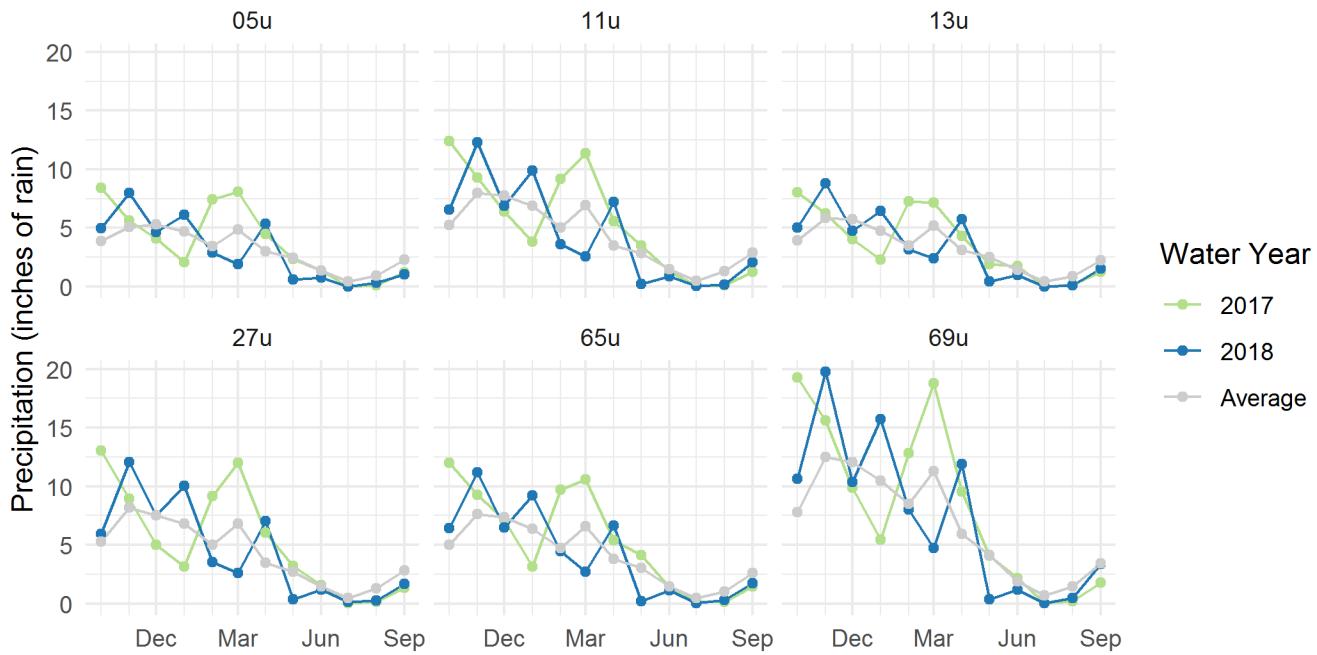

While WY 2018 started with less rainfall than 2017, by early February every site had experienced more cumulative rainfall in 2018 than at the equivalent point in 2017. After that rainfall tapered off; even the mid-April influx of precipitation wasn't enough to lift any of the sites to 2017 levels, and by the end of September every site had accumulated 10 to 20 fewer inches of rain than the previous year.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 7: Monthly Precipitation at Select Stations**

### Monthly Precipitation Totals

The monthly graphs show that the months of March and May in 2018 were particularly dry compared to the long term average. November, January, and April were particularly wet, however, and the combination of three wet and two dry months together lead to cumulative rainfall close to the long term average.

Interestingly, the summers of both 2017 and 2018 were dry compared to long term averages. Dry summers have little impact on cumulative rainfall statistics, since little rain falls in June through September even in wet years, but they could have significant impacts on water consumption, plant stress, and minimum flows in streams.

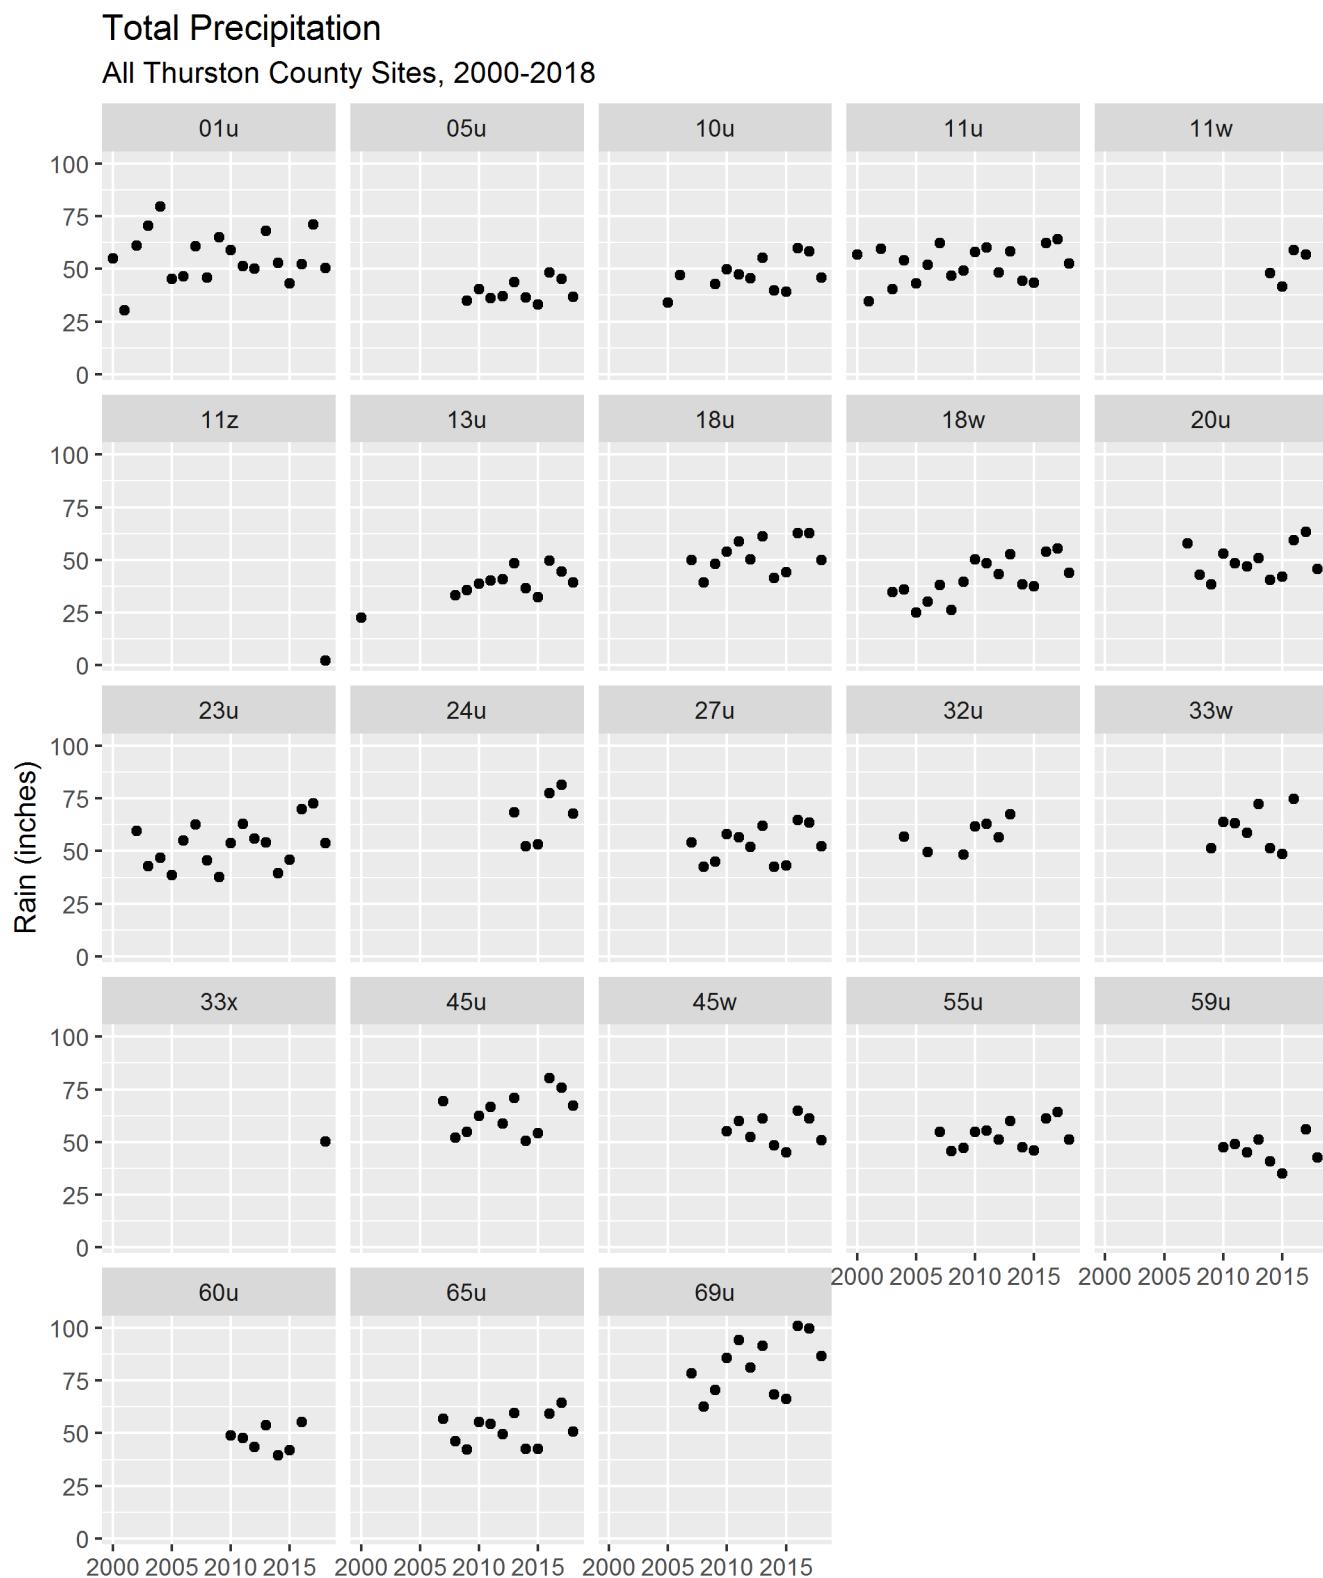

Figure 7 also reveals a trend of increased rainfall in March, which can be observed in the long term averages. In 2017 this wet March effect was evident. In 2018, by contrast, March was drier than both the long term average and the preceding month.

While WY 2018 was neither wet nor dry, over the past 20 years the total annual volume of rain in Thurston County has been increasing. The trend is most obvious at sites 18w (Waste and Recovery Center in Lacey) and 69u (Summit Lake) in Figure 8, but it is apparent at most locations across the county, although it is not statistically significant<sup>7</sup>.

<sup>7</sup> When a linear regression is applied with annual cumulative rainfall as the dependent variable and water year as the independent variable, the p-statistic for most sites is greater than 0.05.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 8: Total Historical Precipitation at All Stations**

## SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

### No Organized Atmospheric Rivers (AR) again in WY 2018

An atmospheric River is a mode of water vapor transport from the tropics into the mid and upper latitudes. They can contain several times more water than is transported by the Amazon River in a given period of time. They occur on the west coast of most continents and are responsible for a large percentage of annual rainfall in many locations. The entire west coast of North America from Southern California to Alaska is within range of AR precipitation events.

In the past, most winter seasons in the Pacific Northwest saw at least one AR event. However, the last AR to reach Thurston County was in 2009. That event was responsible for severe river flooding equivalent to the 1% annual chance (100 year) storm event. It also caused major landslide activity in Thurston County.

In WY 2018 there were two major rain events of just under three inches at the Olympia Airport; one on October 21, 2017, and another on April 14, 2018, neither of which qualified as an AR (in 2009 the Airport received 5 inches of rain the day of the AR). Our rainfall distribution continues to be spread out much more broadly in smaller events between October and April.

The Table below summarizes the average monthly values for the parameters indicated as recorded at the Olympia Regional Airport between January 1, 1951 and March 1, 2019.

**Table 5: Olympia Climate Averages**

## Streamflow

---

### General

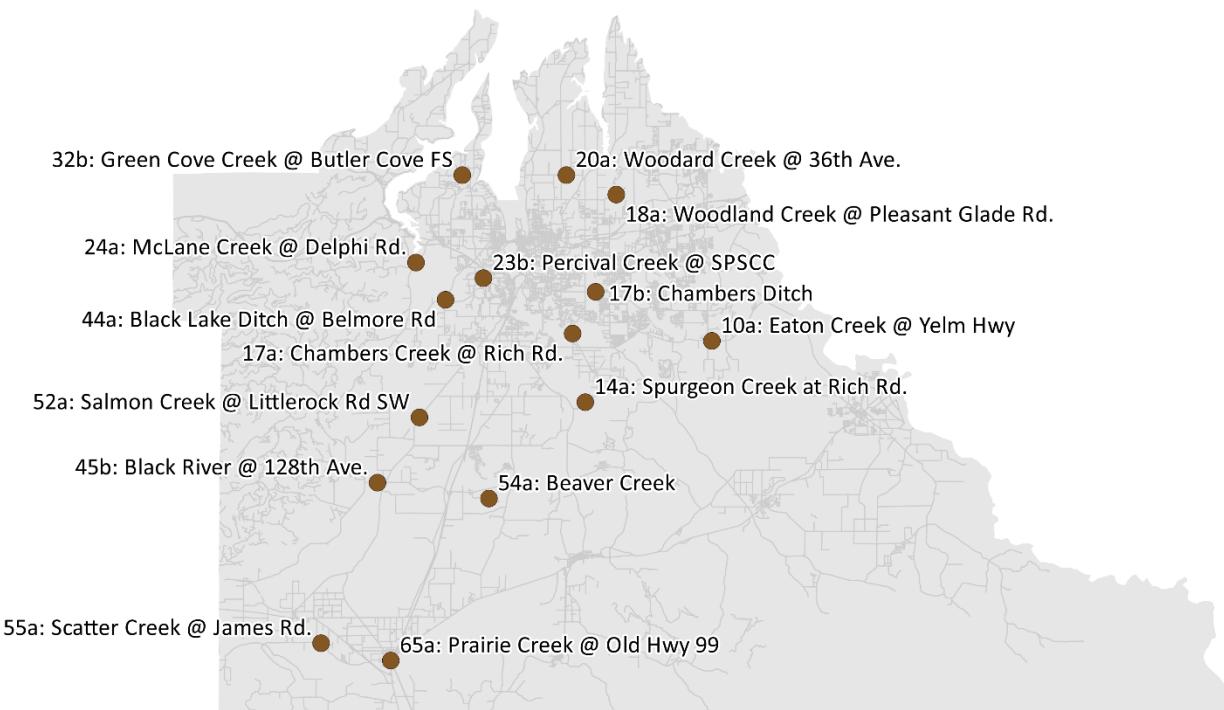

In general, streamflows respond to seasonal rainfall more than groundwater or lake water levels, which respond to longer-term trends. The streams in Thurston County rely on baseflows from groundwater, and therefore do not see the rise in flows during the spring and summer months that are typical from snow pack fed streams. None of the streams that the County monitors have year-round reliance on snow melt.

The urbanized and sub urbanized basins that host the ILMA streams derive their flows from both baseflow (groundwater) and surface runoff from precipitation. The dominant component of these streams depend on the time of year. In general, small streams are fed predominantly by groundwater between June and early October. After the first significant rain events occur, generally in early to mid-October, a combination of groundwater and surface water combine to produce seasonally higher flows that persist during the wet months.

Many of the ILMA streams are in the more urbanized areas of north Thurston County, and in many cases they react quite quickly to urban runoff. Streams that are located in less urbanized areas of the County show a much lower propensity for sharp distribution curves and show a much more muted reaction to rainfall because of the buffering effects of pervious surface such as fields and forests.

**Figure 9: All GEM and ILMA Stream Monitoring Sites**

### Inter-Local Monitoring Agreement Streams

The 2015 – 2018 Interlocal Monitoring Agreement contains funding for five streamflow stations listed in Table 6: ILMA Streams below. These streams have been monitored almost continually since the late 1980s or early 1990s as part of the ILMA and its predecessor agreements.

**Table 6: ILMA Streams**

Streamflow Station	2015 – 2018 Contributing ILMA Partners	Comments
<a href="#">17a</a> - Chambers Creek	Thurston County	Nearly 20 yr record
<a href="#">18a</a> - Woodland Creek	Lacey/Thurston County	20+ yr record
<a href="#">20a</a> - Woodard Creek	Thurston County	20+ yr record
<a href="#">32b</a> - Green Cove Creek	Thurston County	Nearly 20 yr record
<a href="#">44a</a> – Black Lake Ditch outlet	Tumwater/Thurston County	Nearly 15 yr record

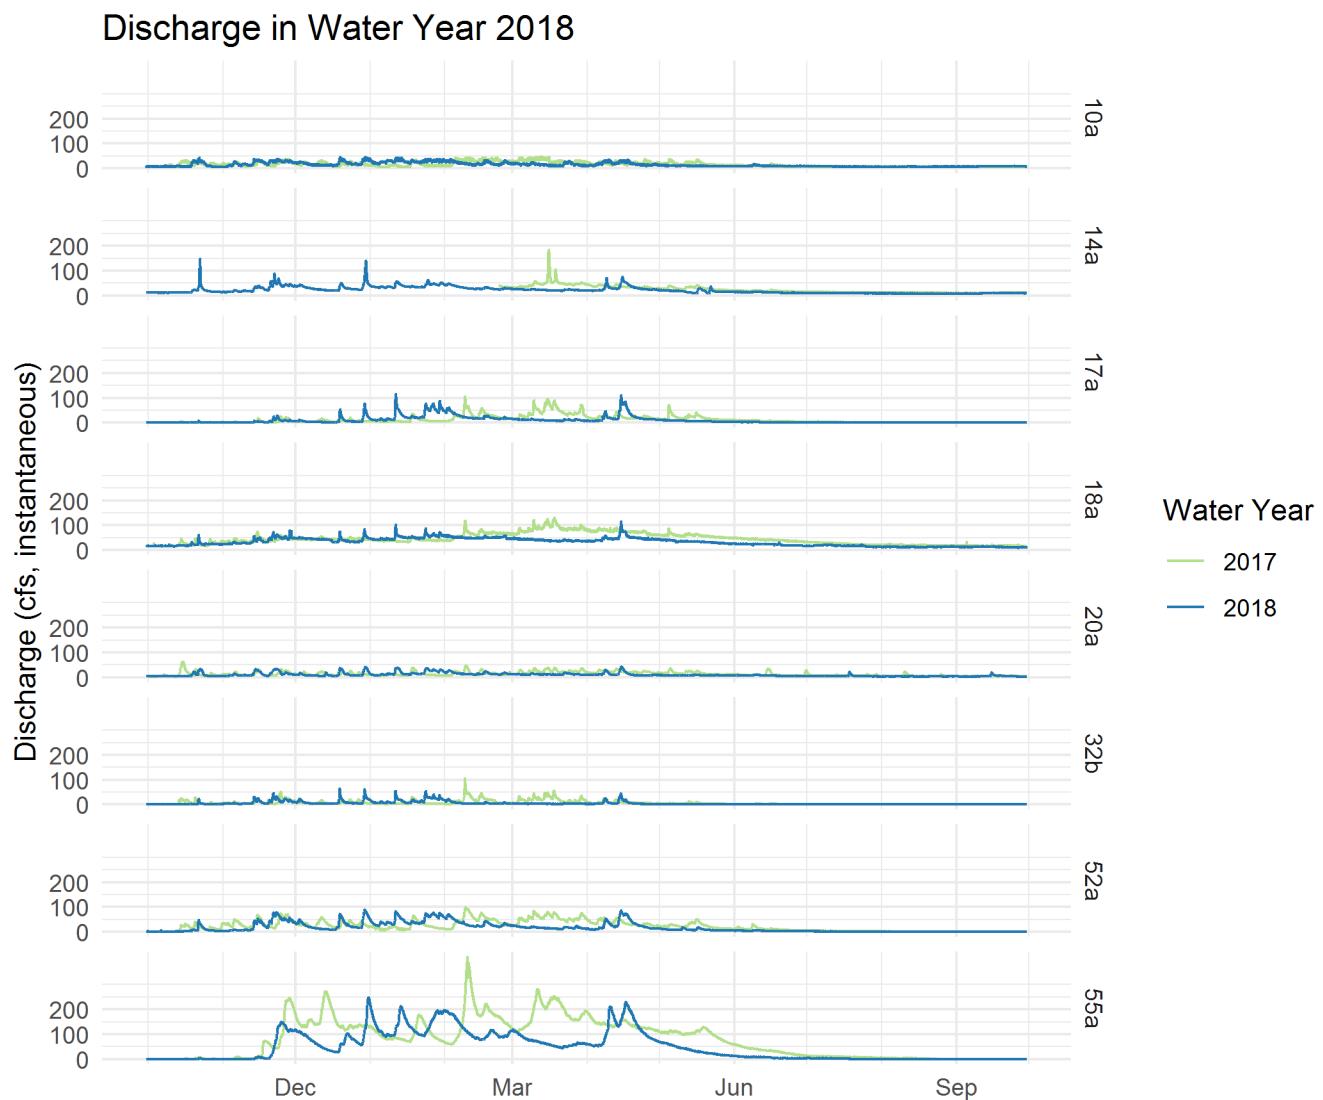

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

## Water Year 2018 Observations of Streamflow

Across the county discharges from streams peak at about the same time, and recede at about the same time, despite sometimes significant differences in total volumes. In WY 2018 there were major discharges in late November/early December, several through January and February, and two in April. In Scatter Creek at James Road (55a) these discharges resulted in days or weeks of discharges in excess of 100 cubic feet per second (cfs), whereas flashier creeks with lower total discharge volumes like Woodland Creek at Pleasant Glade (18a) never discharged as great of volumes, and receded to baseflow more quickly.

Some streams exhibit anomalous behaviors along their hydrograph. Spurgeon Creek (14a) has unusually high discharges in late October and again in mid-June. The origin of these discharges has not been determined (yet), but is likely due to upstream releases of water as culverts under roads are cleared. Similarly, Chambers Creek (17a) experiences intermittent blockages, which can disrupt the hydrograph.

Figure 10: WY 2018 Stream Discharges

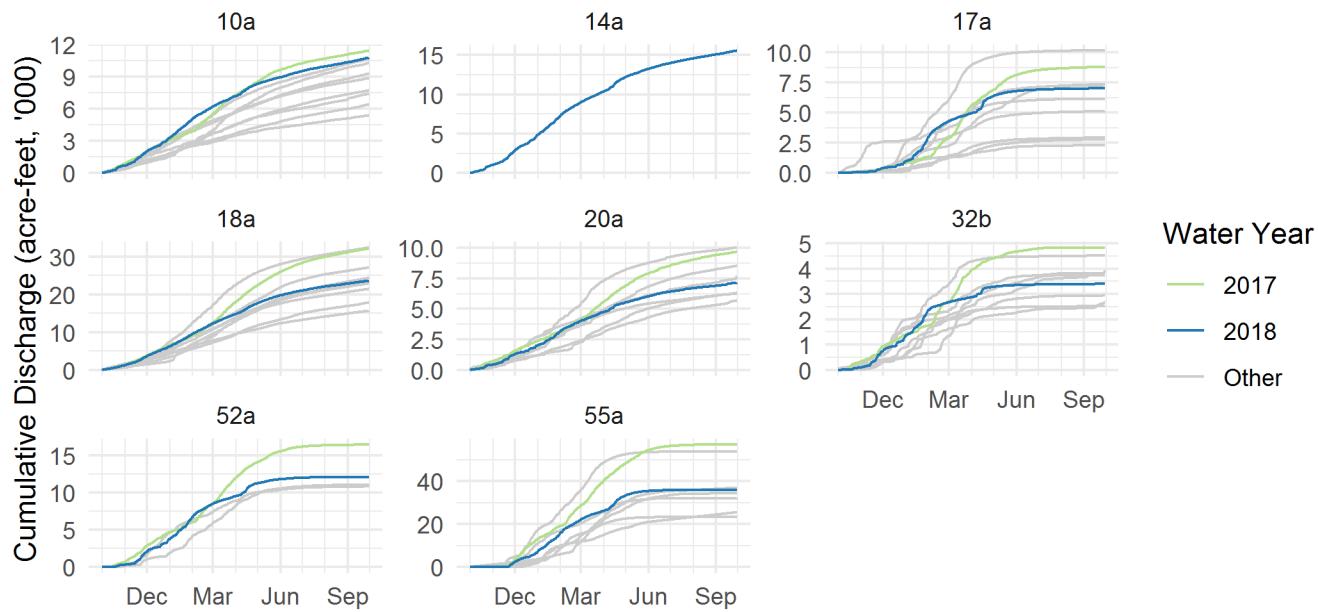

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

The stream flow volumes measured between October 1, 2017 and September 30, 2018 are mostly similar to their long term averages. Early in the water year cumulative discharges (the running sum total of water volume discharged) were high across the county, driven by higher than normal November rainfall volumes. By late winter/early spring cumulative discharges settled into the normal range, where they stayed for the rest of the year.

**Figure 11: WY 2018 Cumulative Stream Discharge Curves**

**Cumulative Discharge Curves**

Y-Axes differ between graphs

The obvious standout in Figure 11 is Eaton Creek (10a), which ended WY 2018 having discharged more total water than in almost any other water year unlike every other creek (and despite 2018 being an average year for total rainfall). Long term data for Spurgeon Creek (14a; data not presented here) presents a similar picture of increasing total discharges over time; as the two creeks share headwaters, this similarity probably has a common underlying cause, which is as yet undetermined.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

## Rivers

Rivers have flows greater than 100 cubic feet per second on average. The larger rivers observed or recorded by Thurston County include the Deschutes, Black, Skookumchuck, Chehalis, and Nisqually rivers. These rivers generally have flows over the threshold that is safe for our field staff to monitor, and therefore we report streamflow data from the U.S. Geological Survey. The Black River at Littlerock is the only exception to this case and is actively waded by field staff if safe to do so.

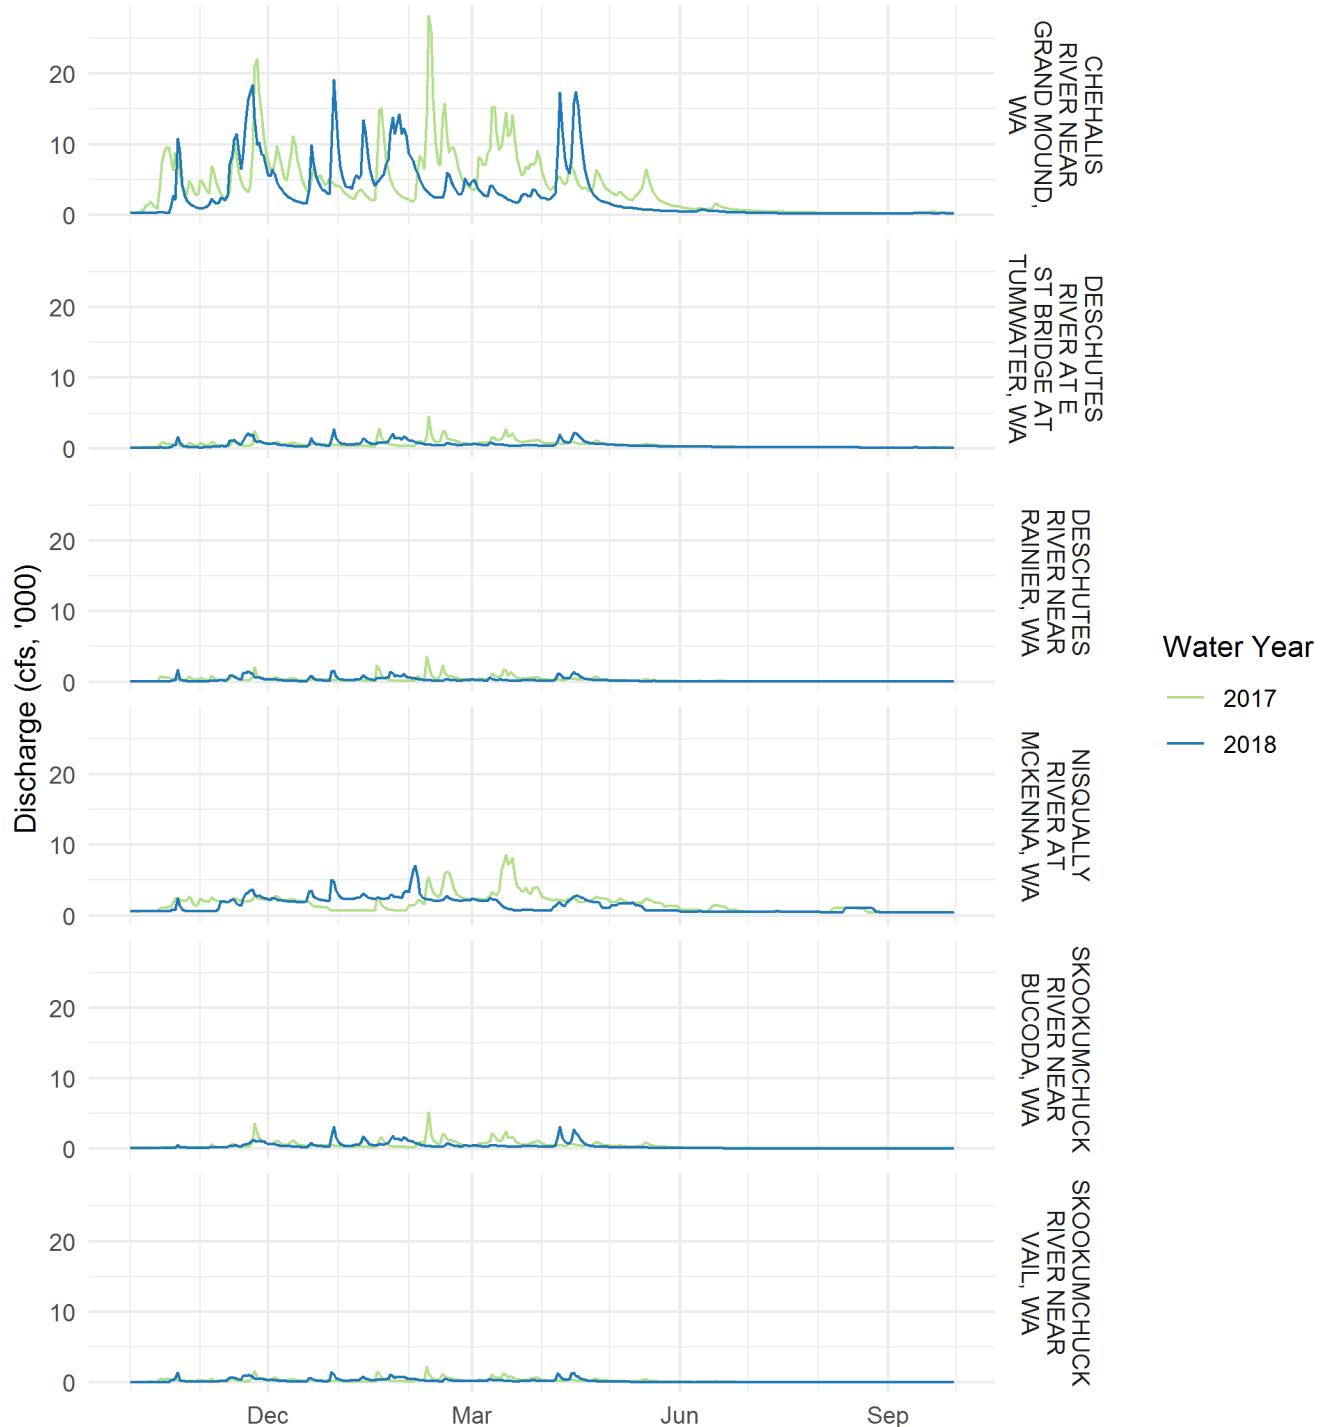

The Nisqually and Chehalis Rivers define the eastern and southwestern borders of the County respectively. Of these, the Nisqually River is the only one that has a consistent year round input from high Cascade Mountain snowpack, and therefore reflects snowmelt in its baseflow, especially in the summer months. The Chehalis River and its tributaries (mainly the Skookumchuck River) have generally low to medium elevation sources, and therefore groundwater or lake contributions are the primary baseflow constituents.

The Nisqually is also mostly controlled by two dams, the La Grande and Alder dams; in Figure 12 below an artificial restriction on March 2018 and a release in July 2018 are both apparent. The Chehalis and Deschutes are mostly unrestricted, and the dam on the Skookumchuck is situated sufficiently far upstream that it has less obvious impacts on flow when compared to the Nisqually.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 12: WY 2018 River Discharges

River Discharge in Water Year 2018

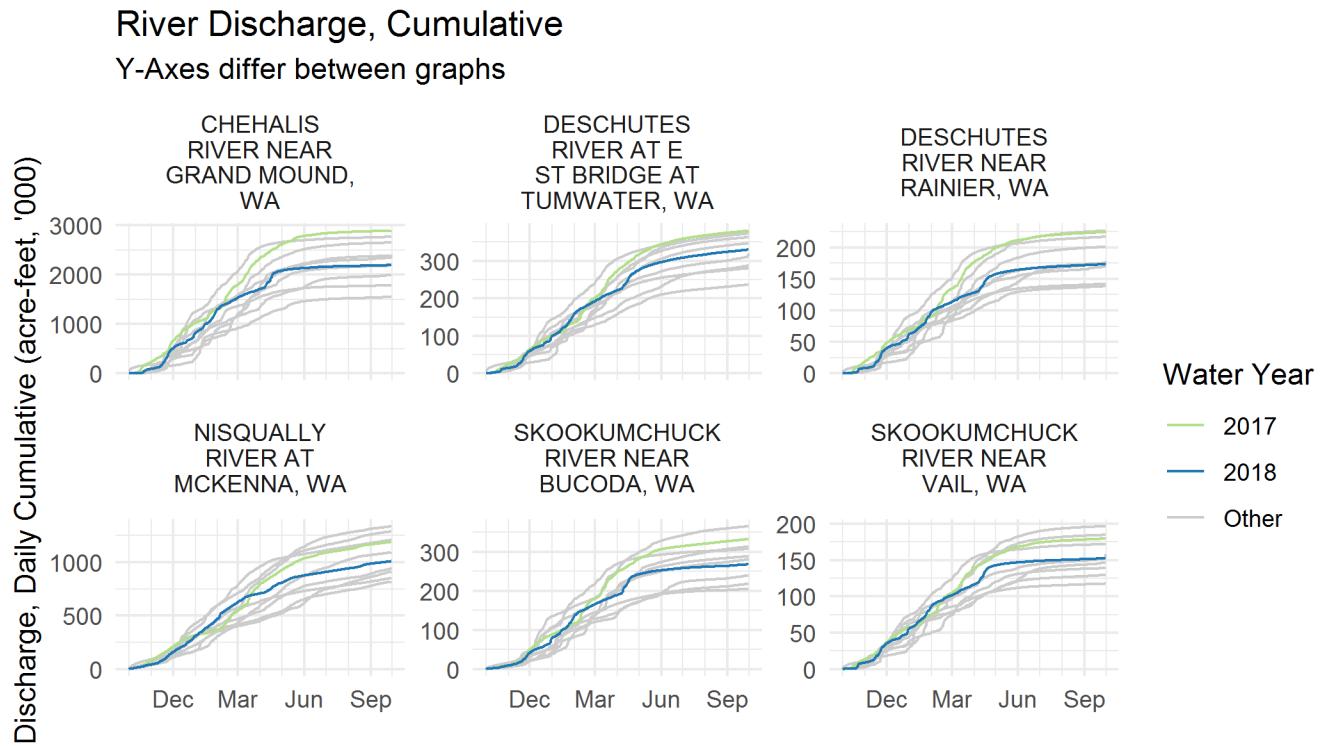

The extreme differences between the rivers in volume of water discharged makes it difficult to compare between them in Figure 12. The Chehalis River discharges a much greater volume of water than the Deschutes,

## SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Nisqually, and Skookumchuck. In the cumulative discharge graphs in Figure 13 below the y-axes are normalized, so it is easier to compare annual trends between rivers, but the total volumes of water differ between the subgraphs.

**Figure 13: WY 2018 Cumulative River Discharge Curves**

At all of the river measurement points water year 2018 ends with a moderate total volume of water discharged, neither high nor low relative to the long-term average. In the Chehalis River cumulative discharge is nearly flat after May, indicating that summer flows are an insignificant percent of the total volume of water discharge. In the Deschutes at Tumwater there is a positive slope all summer long, demonstrating that summer flows are a more important part of that system.

The cumulative discharges of the Chehalis, Deschutes, and Skookumchuck all jump rapidly in April, which accords with the dual peak discharges in that month recorded in Figure 12. In the Nisqually those peaks are muted, and indeed in Figure 13 there is a much smoother overall cumulative discharge graph in water year 2018; this is the result of storing water in the reservoirs during rain events and slowly discharging the resulting volume during dry periods and the summer.

### Water Temperature

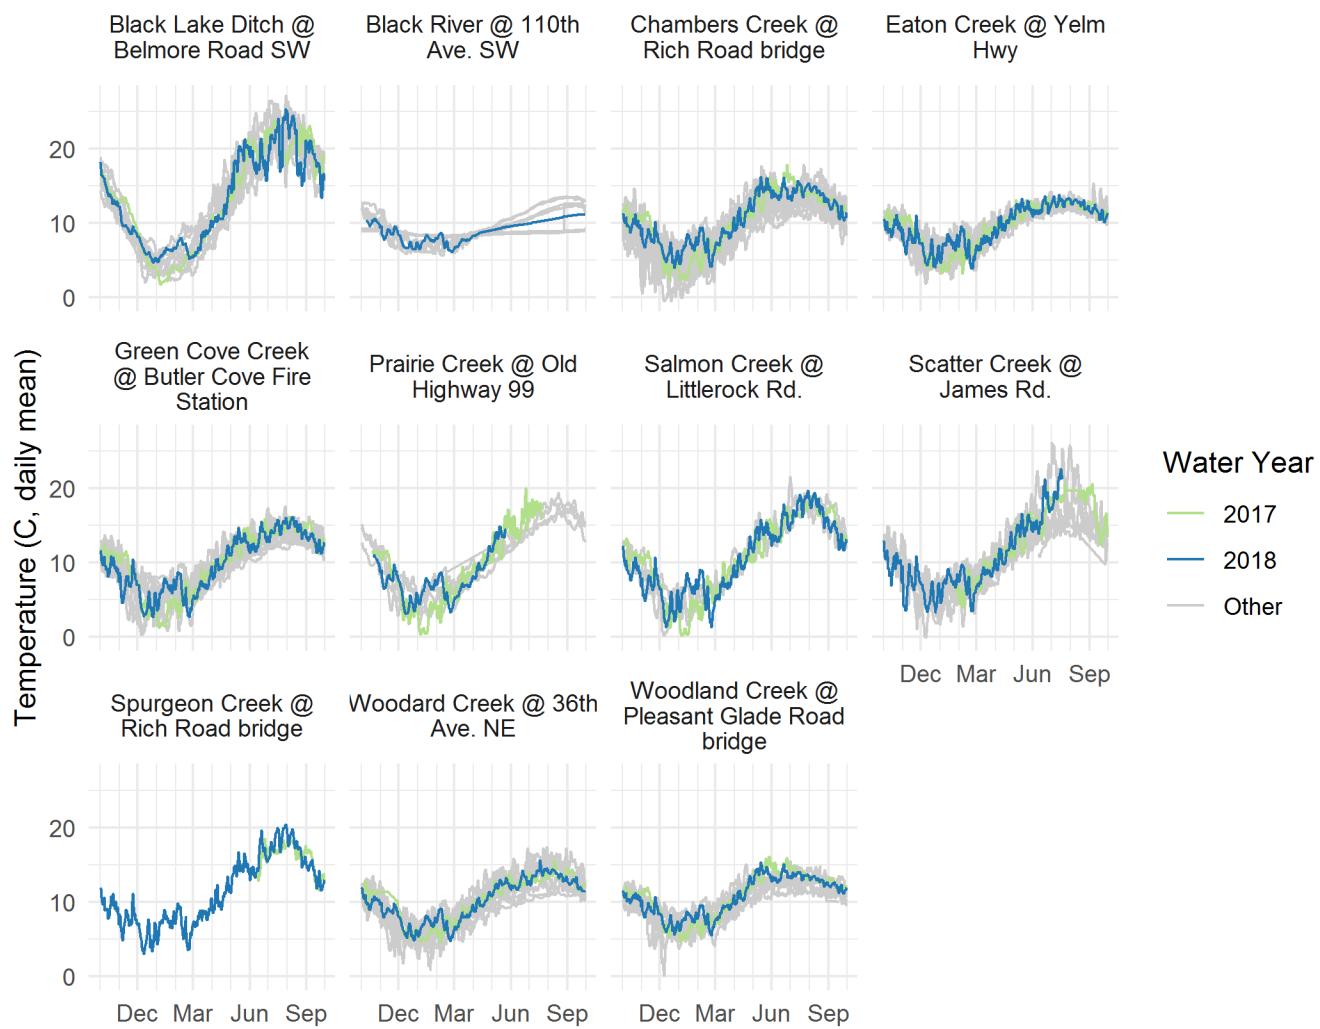

At most stream sites water temperature is recorded by the same device that records stage; sometimes this means that the water temperature is recorded several feet below the surface. Because of this, the continuous water temperature data collected by Thurston County, while valuable, is not always precise; sometimes it reflects near-surface temperatures, and sometimes it reflects temperatures several inches or feet below the surface.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

The range of water temperatures was similar in WY 2018 to WY 2017, and to previous WYs. One standout trend was an increase in temperatures at all sites in January relative to average conditions. That corresponds with an increase in air temperatures (Figure 5), which would be expected to drive increased stream temperatures. It also coincides with a significant rain event (Figure 10) in January which would normally drive water temperatures down (as winter rain tends to be colder than groundwater); it is possible that abnormally warm air temperatures also warmed the rain, which further increased water temperatures.

**Figure 14: Stream Temperatures**

### Stream Water Temperatures

While stream temperature profiles are similar year after year, with temperatures rising in the spring and summer and falling in the fall and winter, there are some key differences in and amongst the sites. Eaton (10a), Woodard (20a), Green Cove (32b), Chambers (17a) and Woodland (18a) creeks all tend to have lower summer peak temperatures than Black Lake Ditch (44a), Salmon Creek (52a), Scatter Creek (55a) and Prairie (65a) creeks. Creeks with lower summer temperatures tend to be groundwater-dominated systems; creeks with higher

**SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning**

temperatures are usually flashier and more dominated by surface runoff. Two additional possible influences are waterbodies immediately upstream, like lakes or wetlands, that warm the water before it discharges to the stream (Black Lake Ditch and Spurgeon Creek), and dried-out stilling wells in ephemeral streams that occasionally result in sensors recording the air, which is warmer, rather than water, which is cooler (Prairie Creek and Scatter Creek).

One important caveat to these data is that they reflect only the high-rate 15-minute monitoring performed by Water Planning; Thurston County Environmental Health has monthly data that extend back much further, and may reflect long-term trends that are not yet captured by the high-rate data.

## Groundwater

---

### General

Groundwater is an important driver of many surface water systems, including streams and lakes.

Peak groundwater elevations in WY 2018 were generally lower than in WY 2017.

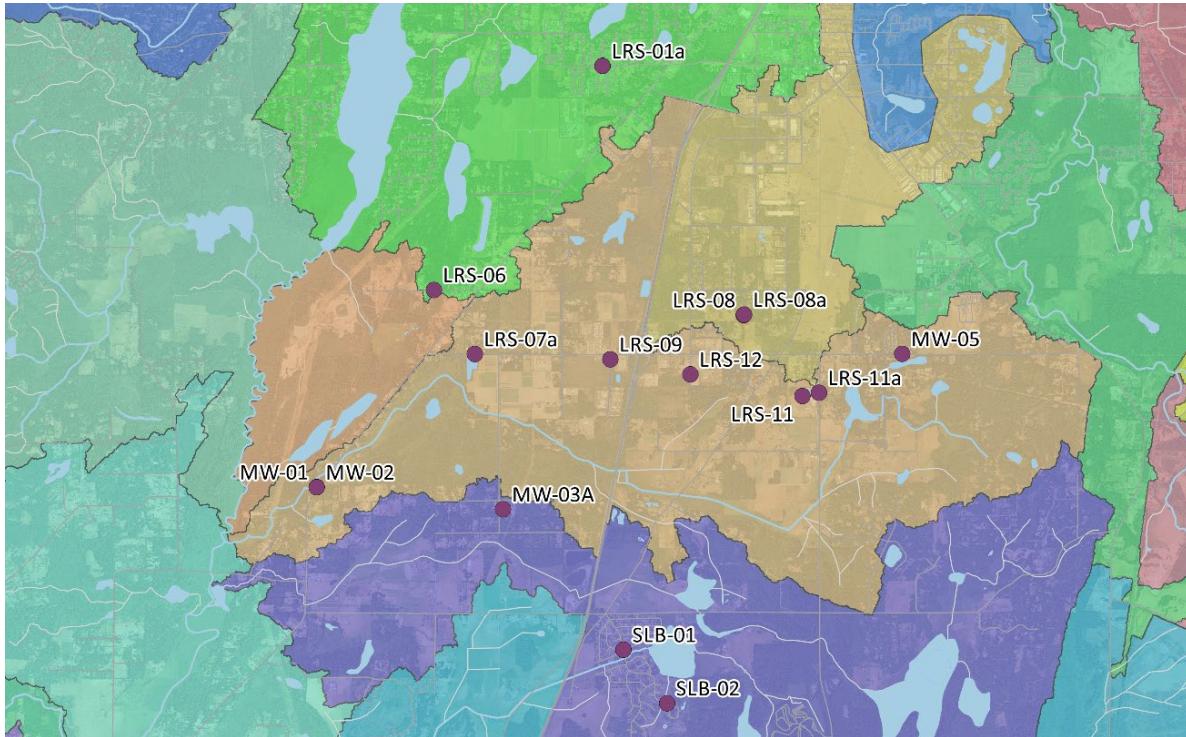

### Groundwater Levels for the 2018 Water Year (Salmon Creek Basin)

Thirteen of the forty-one actively monitored Thurston County groundwater monitoring wells are located south of Tumwater in the Salmon Creek Basin. At the end of WY 2018 Thurston County stopped monitoring three of these Salmon Creek wells (LRS-01a, LRS-09, and LRS-12) because they were in areas annexed by Tumwater.

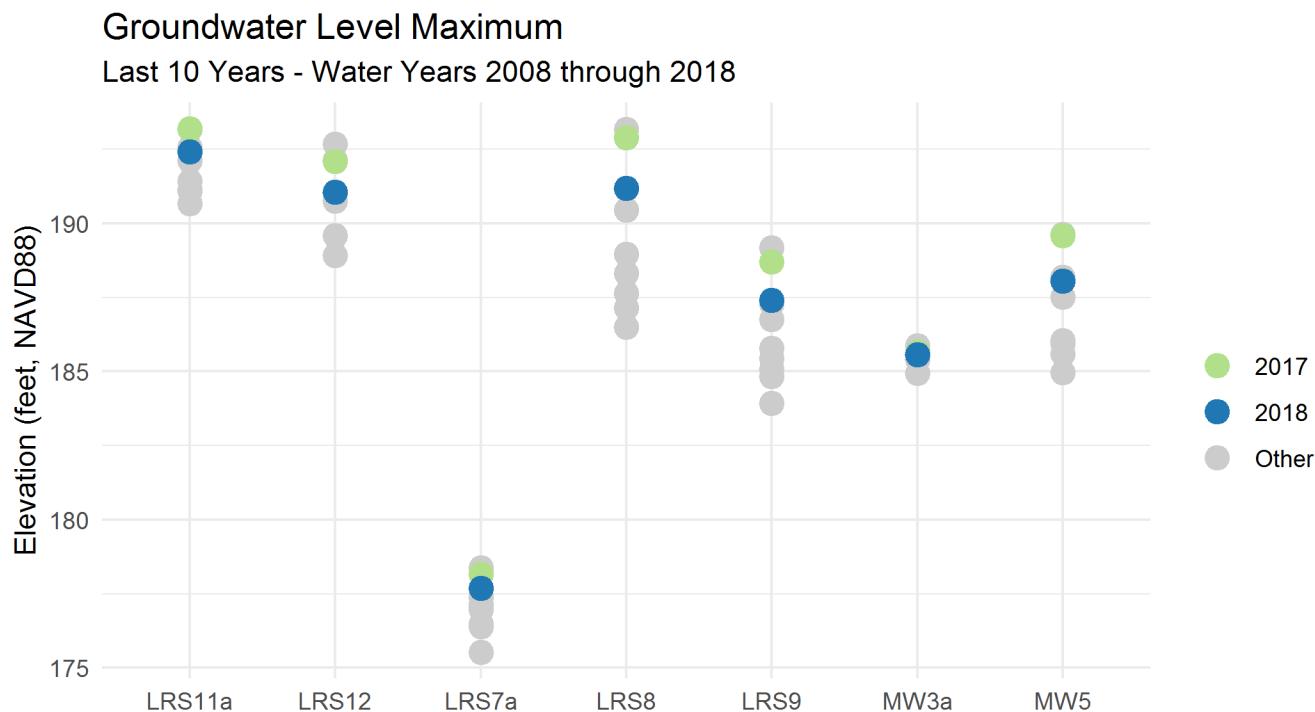

The Salmon Creek area is affected by high groundwater throughout the winter months in most years. There are some areas within the basin that experience flooding annually, and each year there has been an approximately 1 in 20 chance of the groundwater flooding basin wide.

The last widespread flood event occurred in March of 2009. The flood of record by which the Salmon Creek Basin Plan was implemented was based on a major flood event that occurred only ten years before that event, in March 1999. Building and general development requirements within the Basin were modified in response to the 1999 flood. The groundwater data collected by Thurston County is used to calculate flood elevations on prospective parcels in relation to the 1999 flood elevations recorded at the indicator well locations. Figure 15 below is a current map of the location of the groundwater wells in the Salmon Creek Basin.

**Figure 15: Salmon Creek Groundwater Wells Map**

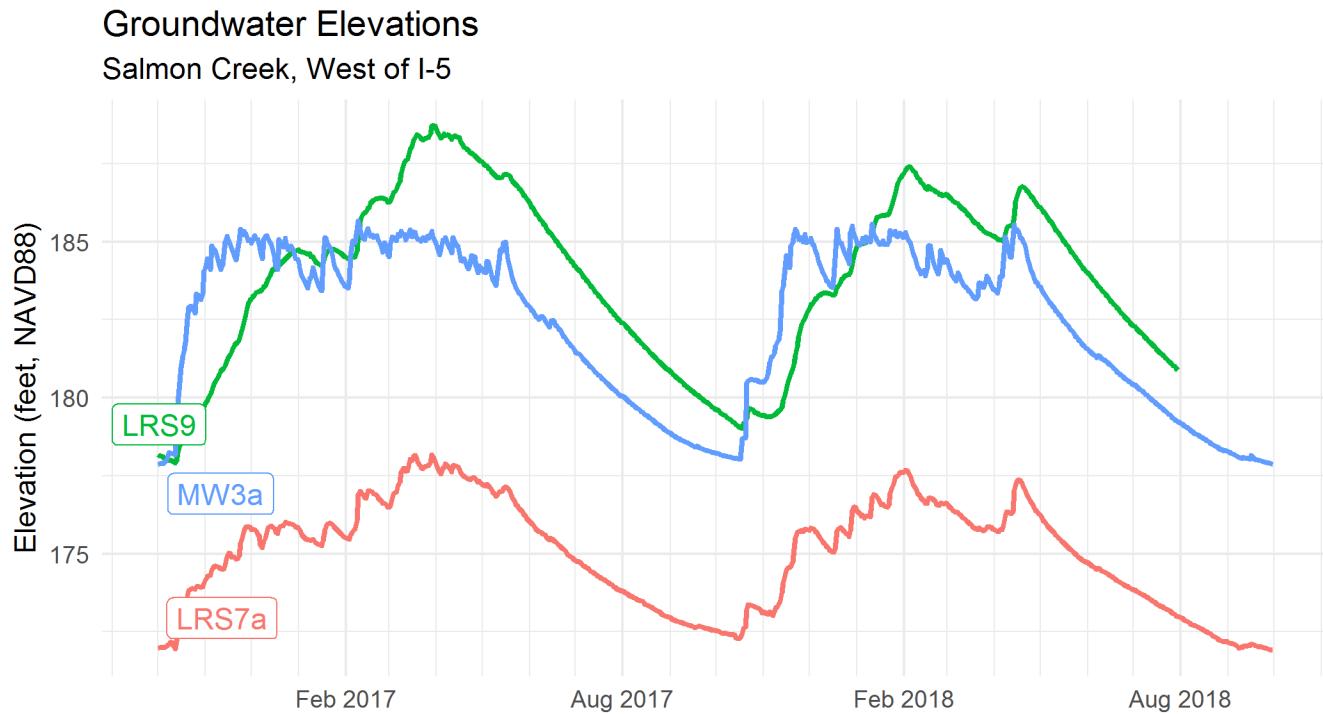

**Figure 16: Salmon Creek Groundwater Maximum Elevation**

Two near-exceptions to this rule are MW3a and LRS7a, where peak groundwater elevations were very similar between the two water years. This is because the geology and hydrology west of I-5, where LRS9, MW3a, and LRS7a are situated, is different from the geology and hydrology east of I-5, where the remainder of the Salmon Creek wells are situated.

**Figure 17: Salmon Creek Groundwater Elevation, West**

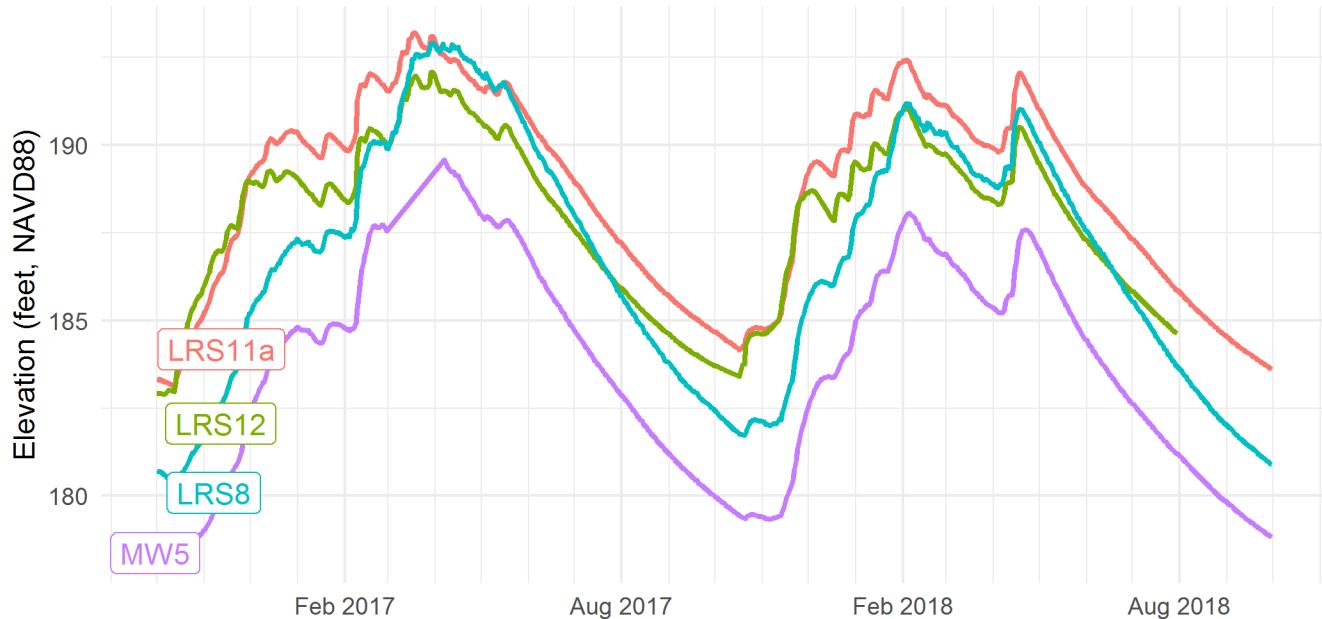

MW3a and LRS7a are shallow wells, and they measure water that discharges to surface water bodies, like ditches, at sufficiently high elevations. Figure 17 shows these wells rising to a certain elevation (about 185' for MW3a and about 177' for LRS7a), then rising no higher, because at that elevation water begins to discharge very rapidly through the roadside ditch system. For that reason, even though there was significantly more rain in WY 2017 than in WY 2018, the maximum elevation in both wells was about the same in both water years. What is noticeably different between those water years is the length of time over which that high water elevation was sustained. In WY 2017 high water lasted from approximately November 2016 to mid-June 2017, or about 8 months; in WY 2018 high water lasted from approximately mid-November to mid-May, or about 7 months, with a significant drop in water levels in March. So while the annual maximum water level was about the same for those wells in both water years, there was less total water volume in WY 2018.

The wells east of I-5, on the other hand, tend to be deeper and only discharge to the surface under significantly wetter conditions.

**Figure 18: Salmon Creek Groundwater Elevation, East**

### Groundwater Elevations

Salmon Creek, East of I-5

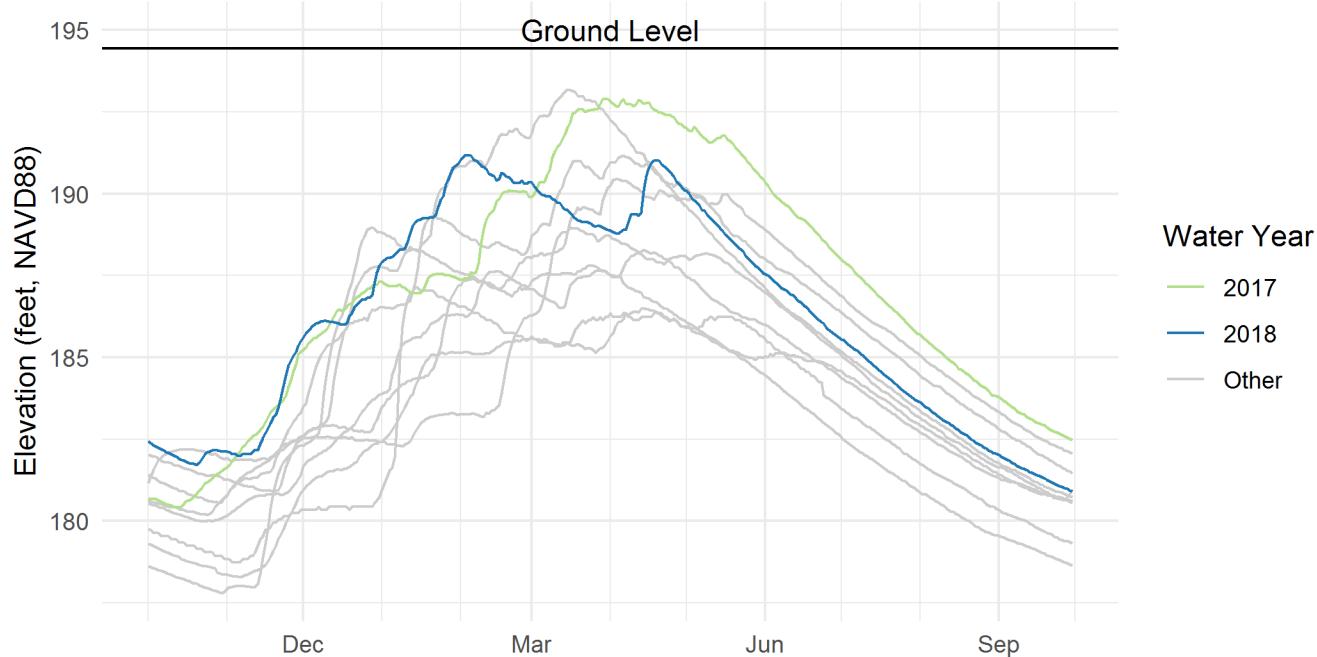

Peak water elevations east of I-5 were lower in WY 2018 than in WY2017. The dry spell in March 2018 is particularly evident in the groundwater record in Figure 18, as is the wet streak in April. The record for MW5 includes a span in March of 2017 where data are missing, which appears as a straight line.

LRS8a, located just off of Walter Court, is the well that best characterizes the overall condition of groundwater in the Salmon Creek basin. In October 2017 LRS-08a was installed, adjacent to the original LRS-08. The two wells were monitored simultaneously for WY 2018 and determined to be effectively identical. This report will sometimes refer to LRS-08 and sometimes to LRS-08a; the data from both wells can be used interchangeably.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 19: LRS-08 Groundwater Elevation Detail

LRS-08: Walter Court

By overlaying multiple water years on the same graph in Figure 19, the differences and similarities between years become apparent.

Groundwater in the Salmon Creek basin began WY 2018 at the highest start-of-water-year elevation it has been in 10 years, raising fears of groundwater flooding. Unlike WY 2017, when a wet October drove up groundwater elevations, in WY 2018 groundwater elevations remained fairly constant until rains began in earnest in November. Up through early February, steady rainfall kept groundwater elevations high as compared to previous years, even exceeding WY 2017 elevations in January. In February and March relatively low rainfall pushed groundwater levels down, both in absolute terms and as compared to previous years. By April, when the next significant rainfall hit the region, groundwater levels had dropped to about normal for that time of year. A dry late spring and summer kept groundwater elevations low, so that water levels ended the water year right in the middle of the normal range, about a foot and a half lower than they began.

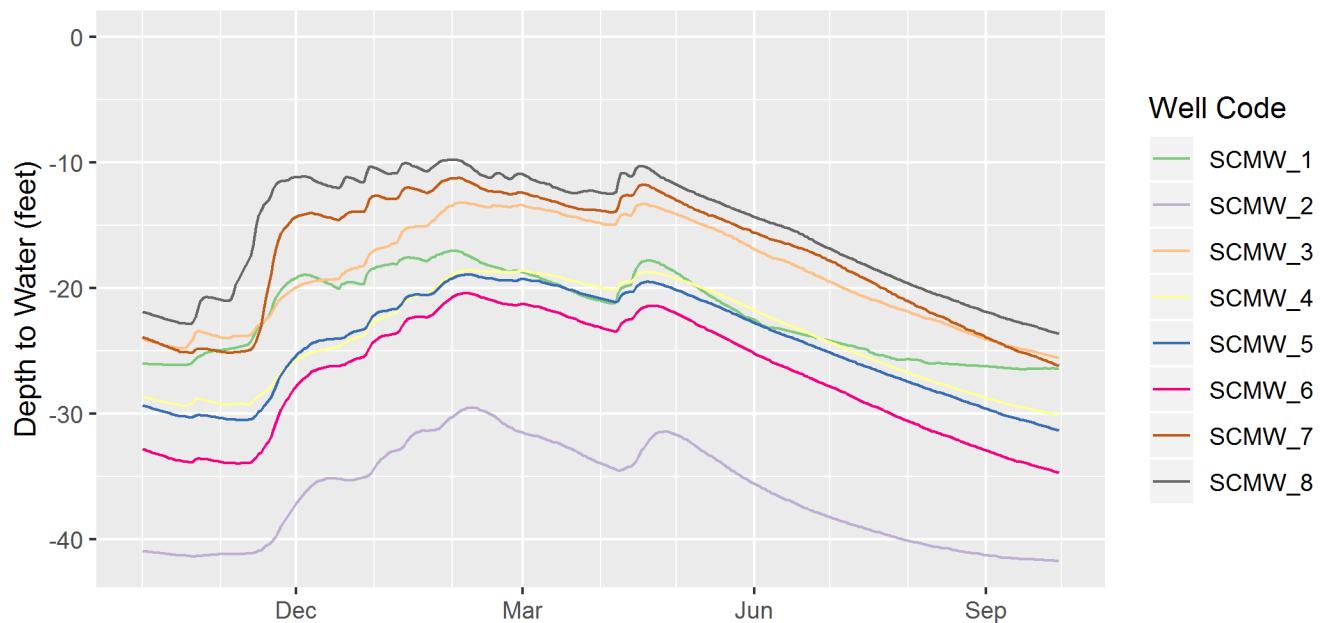

#### Groundwater Levels for the 2018 Water Year (Scatter Creek Basin)

In 2017 eight deep groundwater monitoring wells were installed in the Scatter Creek aquifer in southern Thurston County. Continuous monitoring of these wells began in summer 2017; WY 2018 is the first water year with a complete record.

**Figure 20: Scatter Creek Groundwater Elevation**

### Scatter Creek Wells

Water levels, as depth below ground surface

While historical comparisons are not possible because the wells are so new, most of the Scatter Creek wells responded to rainfall in WY 2018 in a similar manner to the Salmon Creek wells. There was a sharp increase in water elevation in late November, followed by either steady increases (in deeper wells) or maintained water levels through February. Like LRS8 and other Salmon Creek wells, the dry spell in March led to a decline in groundwater elevations throughout the Scatter Creek basin, and rain in April created a mid-spring bounce, followed by a long steady decline in water levels through the end of September. By the end of the water year water elevations were at or below their start-of-water-year elevations.

Figure 20 reveals some interesting deviations from this overall pattern. The first is that wells measuring deeper water, like SCMW\_2 and SCMW\_6, had less pronounced responses to individual rain events, whereas wells with shallower water like SCMW\_8 and SCMW\_7 had more pronounced responses. This is particularly evident in April; the hydrograph for SCMW\_8 clearly shows the influence of two separate rain events in two separate peaks, whereas the SCMW\_2 hydrograph has a single peak in April, as the influences of the two rain events blend together.

Another deviation from the pattern is evident in the hydrographs for SCMW\_1 and SCMW\_2 from June to the end of the water year. While other wells have consistent downward trends in water elevation over that period, water elevations in those two wells drop less and less over time, so that by September there is almost no difference in water elevation between the 1<sup>st</sup> of the month and the 30<sup>th</sup> of the month. One possible explanation is that these wells are more strongly influenced by the Chehalis River, which continues to discharge throughout the summer and could be maintaining higher groundwater elevations during the dry summer months.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

### Groundwater Levels for the 2018 Water Year (Other Basins)

The Salmon Creek Basin is not the only location where groundwater is monitored by Thurston County. It is the most extensive and has the longest, continuous record of groundwater data in the County, but other locations throughout Thurston County where groundwater data is recorded include Tanglewilde in Lacey, the Hidden Forest subdivision (also in Lacey), Scott Lake south of Tumwater, and some smaller sites for project-specific groundwater data requirements. These sites are mostly project specific sites and have data records of ten years or less.

Thurston County will be implementing a new groundwater monitoring program over the three-year period of 2019-2021. The intent of these changes is to create a more comprehensive groundwater monitoring program including high-growth areas in the County where no monitoring is currently performed.

The proposed program will use as many existing, project-specific wells as possible. Some wells in each project area will be abandoned where no longer needed or badly damaged. New wells will be drilled in high-growth parts of the county that are currently not monitored.

## Lakes – St. Clair, Long, Black, and Hicks

---

### General

In 2011 Thurston County Water Resources began collecting lake levels for three major lakes in Thurston County. The three lakes are:

1. **Lake St Clair** in North Eastern Thurston County between Yelm and Lacey
2. **Long Lake** in North Central Thurston County
3. **Black Lake** in North Western Thurston County

In 2018 Thurston County started recording lake level elevations reported by a volunteer on Hicks Lake as well.

4. **Hicks Lake** in North Central Thurston County (upstream of Long Lake)

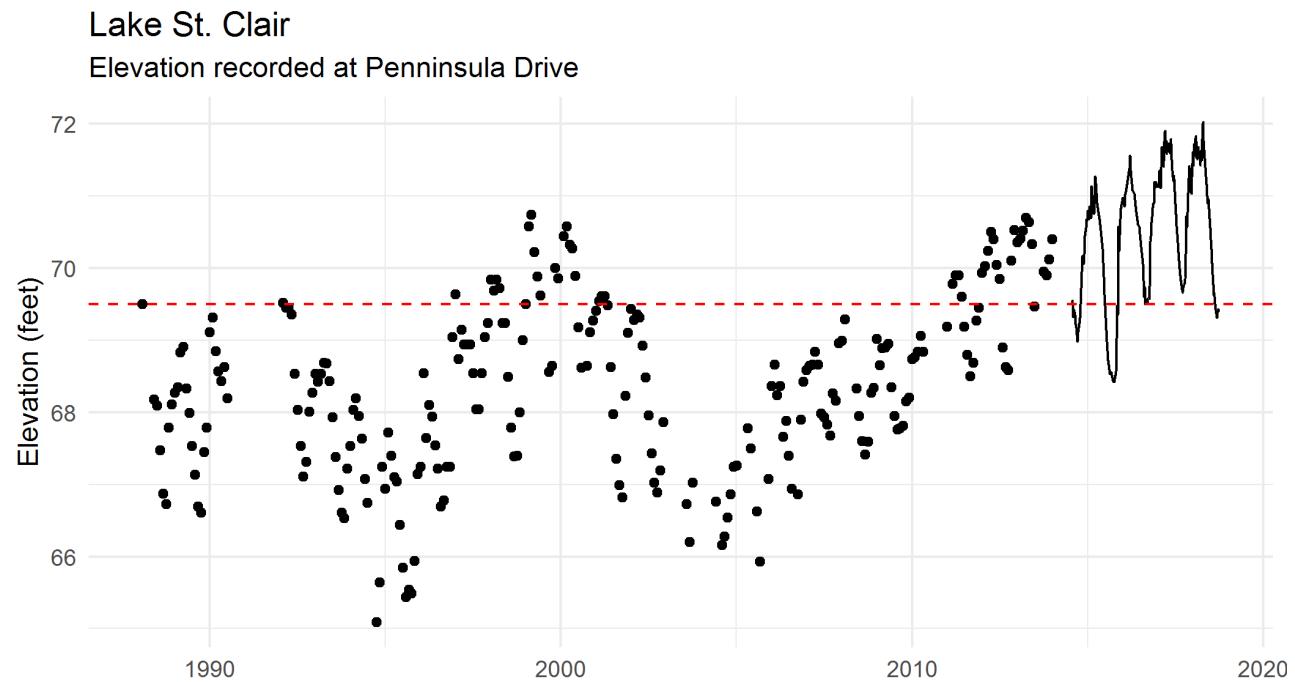

Although there are dozens of lakes in the County, the first three lakes were prioritized because they were the most densely populated and because they are entirely or predominantly within the County jurisdiction. Black Lake and Long Lake share boundaries with or include Urban Growth Areas for Tumwater and Lacey respectively. Lake Level data is also available in Appendix F, and online at <http://www.thurstoncountywa.gov/sw/Pages/monitoring-dashboard.aspx>.

There is also a Lakes Home Page maintained by Thurston County Public Works which oversees the County Lakes Program at [http://www.co.thurston.wa.us/tcweeds/lakes/lakes-home\\_nw.html](http://www.co.thurston.wa.us/tcweeds/lakes/lakes-home_nw.html). The Lakes Home Page is for those lakes with an active Lake Management District (Long and Lawrence) or Lake Special District (Black Lake).

### Lake St. Clair

Lake St. Clair is an isolated kettle lake left over from the continental ice sheet that occupied this region 13,000 years ago. It has no natural surface outlet, so water can only leave the basin by evaporation or groundwater seepage. Over the past 30 years, the level of the lake has varied by about 2 feet annually, and through a range of about 7 feet total.

**Figure 21: Lake St. Clair Elevation**

Datum: NGVD 29' converted from MSL City of Olympia Datum

The red dotted line on the plot indicates 69.5', which is the water elevation at which the 5 MPH speed limit is enacted

Since about 2005 Lake St. Clair has been on a long-term upswing. Despite the low start to WY 2016 because of the preceding drought year, the water years 2016 through 2018 had the highest levels in Lake St. Clair recorded since 1988. While the maximum level in 2018 was the highest recorded in that 30-year span, the lake also ended the water year with the lowest water level since WY 2016.

Thurston County Water Planning continues to study Lake St. Clair and the drivers behind the observed multi-year fluctuations. Evidence increasingly points to strong surface water influences on the lake, and may indicate minimal groundwater interaction above a baseline elevation. Since Eaton Creek is the primary surface water input to the lake, the fact that annual discharge in the creek have gone up over the past ten years (see Figure 11, graph for 10a) is probably relevant to the steady increase in lake level measurements.

### Long Lake

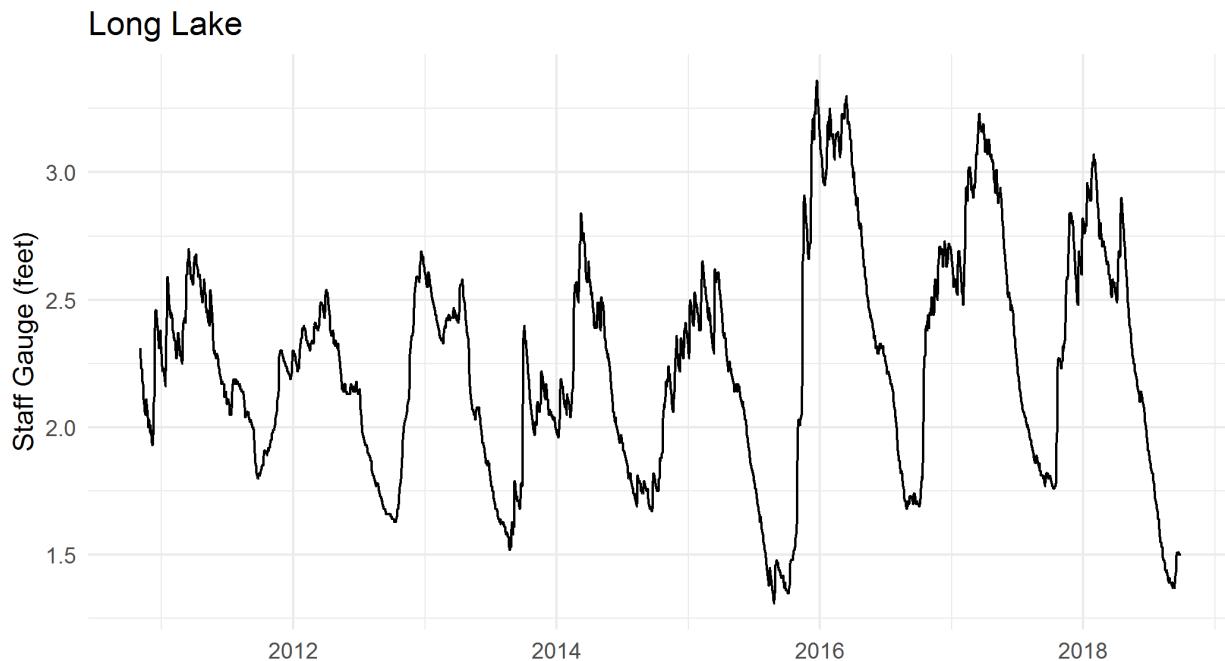

Long Lake is located in the southeastern Urban Growth Area of Lacey and is highly urbanized like most of the surrounding lakes. Long Lake is part of a three lake group that also includes Pattison Lake and Hicks Lake. These lakes are hydraulically connected by surface and subsurface flow ways. Unlike Lake St. Clair, Long Lake has a well-defined outlet that constitutes the headwaters of Woodland Creek.

Long Lake has also experienced higher than average seasonal lake levels during WY 2018, though unlike Lake St. Clair, WY 2018 was lower than the preceding two water years.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

Figure 22 below represents data collected from the Holmes Island Bridge gauge that Thurston County maintains. The chart includes data from WYs 2011 through 2018 to illustrate the range of surface stage that seasonally occurs.

**Figure 22: Long Lake Staff Gauge**

Much like Lake St. Clair, water years 2016, 2017, and 2018 all had similar annual peak water elevations; also like Lake St. Clair, the minimum elevation in WY 2018 was much lower than the minimum elevation in the preceding two years.

### Black Lake

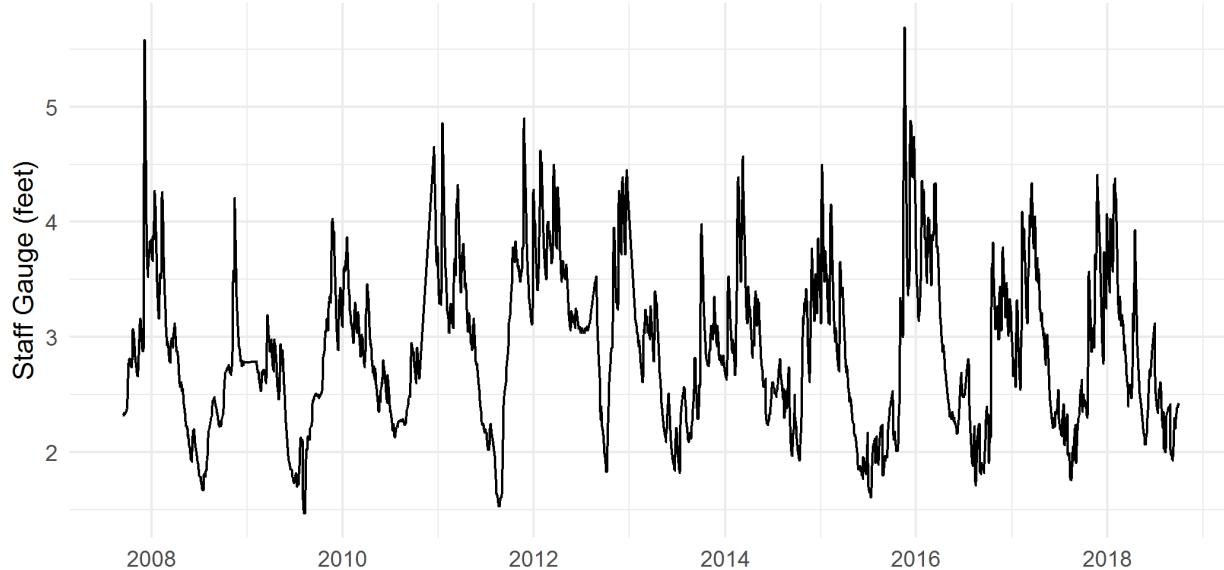

Black Lake also responds to variations in precipitation in predictable ways. This lake, however, responds more quickly than most lakes. The Black Lake Basin is located west of Olympia, adjacent to the Urban Growth Area for the City of Tumwater. It is situated between the predominantly basaltic Black Hills and Somerset Hill in Tumwater. This basin has highly impermeable rock and glacial till underlying the surface layers. In addition, the topography is steep, and this basin receives approximately 25 percent higher precipitation than the Olympia airport only five miles to the east. Finally, beavers regularly block the outlet of the lake, and those dams are regularly removed, resulting in sudden jumps and falls in water levels. As a result of this combination of factors – geology, topography, intensified precipitation, and beaver activity - the lake rises and falls more like a river than a lake. The figure below is a chart of WYs 2008 through 2018.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 23: Black Lake Staff Gauge**

**Black Lake**

Measured at Belmore bridge

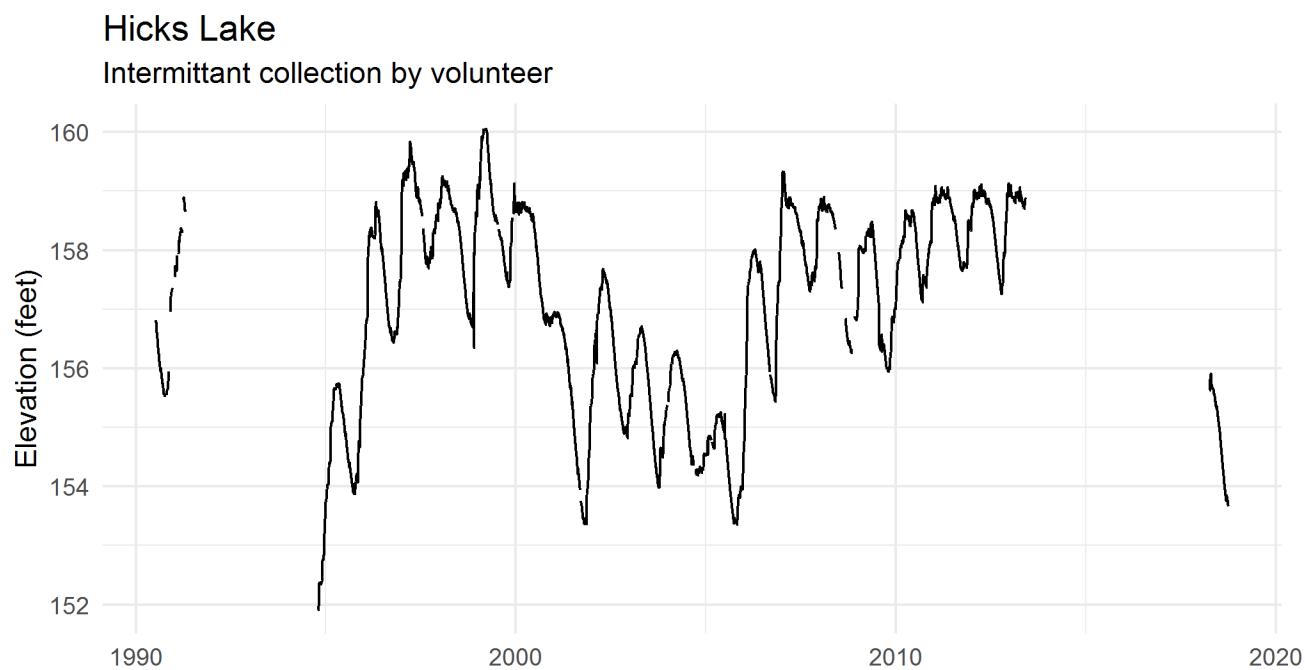

The hydrograph of Black Lake Ditch is much less regular than the hydrographs of other lakes in Thurston County, with many sudden peaks and falls for the reasons described above. Nevertheless, there is an apparent annual trend in the data, with peaks in the winter wet season and lows in the summer dry season. WY 2018 looks very similar to WY 2017, with nearly identical annual maximum and minimum water levels; that stands in contrast to other lakes in the County, where WY 2018 minimum lake levels were much lower than WY 2017.

**Hicks Lake**

Volunteers have monitored water levels at Hicks Lake for many years. Between WYs 2014 and 2017 Thurston County was not recording the collected data, but recording restarted in the middle of WY 2018.

SUMMARY REPORT and ANALYSIS for WATER YEAR 2018: including Atmospheric, Streamflow, Groundwater and Lake Level Data – Thurston County Water Planning

**Figure 24: Hicks Lake Elevation**

Because data collection at Hicks Lake only restarted recently, WY 2018 is incomplete and difficult to compare to previous years. Despite that, Figure 24 shows WY 2018 ended much lower than the years between 2007 and 2013. Overall the pattern in Hicks is somewhat similar to the pattern in Lake St. Clair (where there are data to compare the two).

## Summary of Water Year 2018

---

Compared to the drought year of WY 2016 and the wet years of 2016-2017, WY 2018 was a return to normal. Temperatures and rainfall patterns hewed closer to the long term average, which had a stabilizing effect on most stream discharge volumes and lake levels.

More specifically, WY 2018 began with high groundwater and lake levels from the previous two years of above-average precipitation. From October through December air temperatures were normal and rainfall amounts were near or slightly above average, leading to normal stream discharges and above average groundwater levels. In January a pulse of warm, wet weather pushed some precipitation stations above their WY 2017 cumulative rainfall amounts, and drove increases in both stream discharge volumes and in surface and shallow groundwater temperatures. A drier than usual February and March dropped groundwater levels from near or at their (high) WY 2017 elevations to approximately normal elevations, before a wet April pushed them back up again and created a noticeable spike in discharge at most stream gauges. The dry remainder of the water year caused groundwater and lake water levels to end the water year near their long-term averages.

## Closing

Thurston County Water Planning has continued to collect data for our Regional Interlocal Monitoring partners and our General Environmental Monitoring program for almost twenty years. Together with the Thurston County Environmental Health Division, we collect millions of data points per year for processing and modelling. All of the data collected by our programs is available electronically at no cost to the public and other government agencies, either at <http://www.thurstoncountywa.gov/sw/Pages/monitoring.aspx> or by directly contacting Thurston County staff. The program is continuing to evolve with new technologies and analytical techniques. We will be striving to provide the highest quality data for quantifying our local water cycle and integrating it with our regional partners. We will be continuing to improve our data quality and services with new locations and using remote sensing technologies in the upcoming years. We will be providing additional services for groundwater, surface water flows and atmospheric monitoring and lake levels. We will continue to integrate our data and program elements with Thurston County Environmental Health through a shared database and other cooperative efforts. That in turn will provide a more complete picture of the health of our water resources in Thurston County.

The water cycle begins in the clouds and ends in Puget Sound or the Pacific Ocean, and we attempt to quantify it at every level from the raindrops, streams, ground, and lakes until it returns to its source.

## Appendix A –Precipitation Data

Total Rainfall for Water Year 2018: 67.30

Notes:

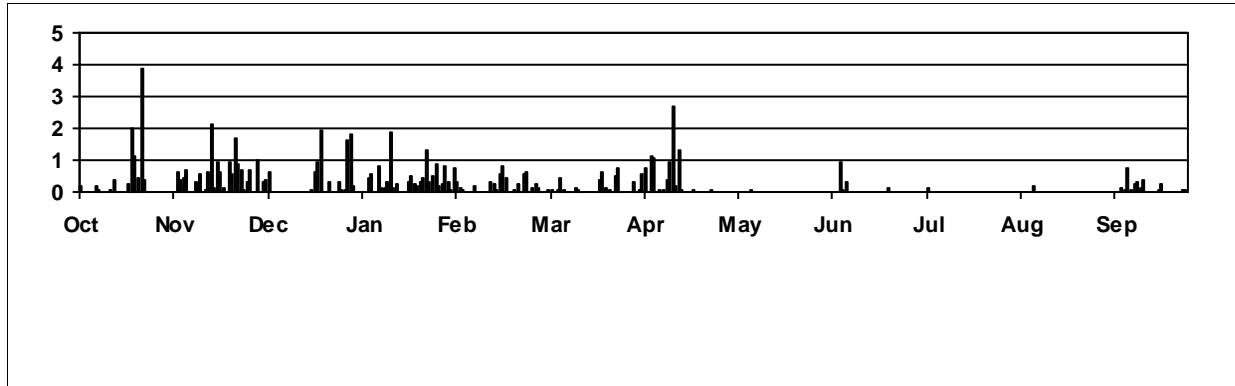

Precipitation is measured with a tipping bucket rain gauge. Ice and snow accumulations in the rain gauge are not measured until they melt.

Precipitation from snow is not measured accurately

Thurston County
